**November 2024**

## PREFACE

The Asphalt Institute originally produced much of the material in this manual under contract with the Federal Highway Administration (FHWA) as the National Asphalt Training Center (NATC) for Superpave technology. The NATC developed and conducted week-long training courses in Superpave binder and mixture technology administered by the FHWA's Office of Technology Applications.

The Kansas Department of Transportation (KDOT) and the Department of Civil Engineering at Kansas State University provided financial support for preparing this handbook. The authors are indebted to Rodney G. Maag, P.E. (retired), Glenn A. Fager, P.E. (retired), and Richard Kreider, Jr., P.E. (retired) of KDOT, for their review and comments on this manual.

In 1987, the Strategic Highway Research Program (SHRP) - a 5-year, 150-million-dollar federal research program authorized by Congress, began developing a new system for specifying asphalt materials. The final product of the SHRP asphalt research program was a new system called Superpave, an abbreviation for **Superior Performing Asphalt Pavements**. Superpave represents an improved system for specifying asphalt binders and mineral aggregates, developing asphalt mixture design, and analyzing and establishing pavement performance prediction. The system includes an asphalt binder specification, a hot-mix asphalt (HMA) design and analysis system, and computer software that integrates the system components. The Superpave binder specification and mix design system include various test equipment, methods, and criteria. The criteria are dictated by a particular pavement site's traffic, environment (climate), and structural section. The Superpave system has resulted in huge savings.

The Superpave system applies to **virgin or recycled, dense-graded HMA** with or without modification. It can be used when constructing new surfaces, binders, base courses, and overlays on existing pavements. Material selection (aggregate and asphalt) and mix design directly address reducing and controlling **rutting (permanent deformation), fatigue cracking, and low-temperature cracking**. It also explicitly considers the effects of **aging and moisture sensitivity** in promoting or arresting the development of these distresses.

Kansas strives to build better HMA pavements, and careful implementation of this mixed design process is essential to achieve that goal.

## WHY SUPERPAVE?

A brief review of the history of highway development and the asphalt industry can help you fully understand the evolution of the Superpave system.

Since the development of the gas engine and the discovery of the petroleum asphalt refining process, asphalt has seen increasingly widespread use in pavement applications. From road oiling of local roads to heavy-duty airfield applications, the versatility of asphalt materials has provided the pavement engineer with valuable road construction material.

The design of asphalt mixtures evolved with its increasing use. The Hubbard-Field method was initially developed in the 1920s for sheet asphalt mixtures with 100 percent passing the 4.75 mm sieve. It was later modified to cover the design of coarser asphalt mixtures. The Hubbard-Field Stability test measured the strength of the asphalt mixture with a punching-type shear load. Hveem Mix Design was developed by the California Department of Highways Materials and Design Engineer Mr. Francis Hveem in the 1930s. The Hveem stabilometer measures an asphalt mixture's ability to resist lateral movement under a vertical load. Hveem mix design was used in California and other western states. Marshall mix design was initially developed by a Mississippi State Highway Department Engineer, Mr. Bruce Marshall, and later refined in the 1940s by the Corps of Engineers for designing asphalt mixtures for airfield pavements. The primary features of the Marshall mix design are a **density/voids analysis** and the **stability/flow test**. Before Superpave, Marshall mix design was widely used in the United States and is, by far, the most commonly used asphalt mixture design procedure worldwide.

Refinements to the concepts of asphalt mix design procedures resulted from the increased use of asphalt and the increased demand placed on the mixtures by increased traffic volume and loading. The authorization of the Interstate Highway System in 1956 set the cornerstone for the United States' reliance on highway transportation as its primary mode of transporting goods and people.

The AASHO Road Test, conducted from 1958 to 1962, set the standard for pavement structural design, and the results are still the basis for the majority of currently used pavement design procedures. The researchers were aware that the Road Test was limited to one set of soils and climatic conditions, and other studies were needed to extend the findings to other geographic areas. Generally, these studies were not conducted, and the AASHO Road Test results were extrapolated to fit different design conditions.

The growth of the Interstate system was matched by the increase in trucking as a mode for shipping goods. The Interstate System in Kansas comprises less than 1 percent of the total road mileage in the State (872 miles) but carried over 22 percent of the travel (approximately 17.8 million DVMT) in 2000. Heavy commercial vehicles make up more than 20 percent of the vehicle traffic on the rural Interstate highways. The volume of large trucks on the rural state system has grown faster. Heavy truck travel has increased 67% between 1990 and 2000 (Figure 1). Provided with an infrastructure to transport the goods, the trucking industry pushed for increased productivity, and

the legal load limit was raised from 73,280 to 80,000 lb. in 1982. This seemingly slight increase increases the stress on the pavement by 40 to 50 percent for a given structural design. The advent of more economical radial tires also increased the stress on the pavement.

## Travel (VMT in Million Miles) On Kansas State Highway System (1970-2000)

Figure 1 Trends of Daily Vehicle Miles Traveled (DVMT) and Truck Daily Vehicle Miles Traveled (TDVMT) in Kansas

As the transportation industry grew, the use of hot mix asphalt in heavy-duty pavement applications also grew, and the results were not always favorable. States were finding an increasingly fine line between mixtures performing well and poorly. The materials were the same, but the traffic load and volume increased the need to understand asphalt materials and pavement performance better.

### STRATEGIC HIGHWAY RESEARCH PROGRAM (SHRP)

Against this declining performance and diminishing research funding, Congress approved SHRP in 1987 as a five-year, \$150 million research program to improve the performance and durability of United States roads and make them safer for motorists and highway workers. One-third of the SHRP research funds were directed toward developing performance-based asphalt material specifications to more closely relate laboratory measurements with field performance.

SHRP was initially proposed in Transportation Research Board Special Report No. 202,

"America's Highways: Accelerating the Search for Innovation." This report outlined the need for a concentrated effort to produce significant innovations for increasing the productivity of the nation's highways. Various problems in highway performance and safety areas have been hampering the highway industry, and this report called for a renewed effort to solve these problems. However, this report did not just call for research funding in these areas but also emphasized the need to conduct the research with implementation in mind. A "program designed without taking into account obstacles on implementation of research will fail," noted the report, and this statement continues to guide the highway industry now that the SHRP research is complete. Its products have been implemented to a large extent.

## BACKGROUND

Asphalt mixtures have typically been designed using empirical laboratory design procedures, meaning that field experience is required to determine if the laboratory analysis correlates with pavement performance. However, even with proper adherence to these procedures and the development of mixed design criteria, good performance cannot be assured using these mixed designs.

In contrast, the new Superpave system is a performance-based specification system. The tests and analyses have direct relationships to field performance. For example, the Superpave asphalt binder tests measure physical properties that can be related directly to field performance by engineering principles. The Superpave binder tests are also conducted at temperatures encountered by in-service pavements. Also, the Superpave mix design system integrates material selection (asphalt and aggregates) and mix design into procedures based on the project's structural section, climate, and design traffic. Particular attention has also been paid to the real-world process of asphalt mixture mixing - loose mixture samples, before compaction to make test samples, are oven-aged at compaction temperature to simulate the aging that occurs during plant mixing, hauling to the project site, and compaction.

Two new key features in the Superpave system are **laboratory compaction** and **mixture performance testing**. Laboratory compaction is accomplished using a Superpave Gyratory Compactor (SGC). While the primary purpose of SGC is to compact test specimens, it can provide valuable information about the compactability of the particular mixture by capturing data during compaction. The SGC can be used to design mixtures that do not exhibit tender mix behavior and do not densify to *undesirable* low air void contents under traffic action. In Superpave, test procedures and performance prediction models were developed to estimate the performance life of a prospective Superpave pavement.

Superpave mixture design and analysis is performed at *one of three increasingly rigorous levels*, each providing more information about mixture performance. **Superpave volumetric mix design** (*originally termed Superpave level 1*) is an improved material selection and volumetric mix design process and applies to projects with design traffic (ESALs) up to 1 million. **Superpave abbreviated mix analysis** (*original Level 2 mix design*) procedures use the volumetric mix design as a starting point, including a battery of SST and IDT tests to arrive at a series of performance predictions. This level applies to traffic levels between 1 and 10 million. **Superpave full mix analysis** (*original Level 3 mixture design*) includes a more comprehensive array of SST and IDT tests and results to achieve a more reliable level of performance prediction for projects with traffic levels greater than 10 million.

## SUPERPAVE SYMBOLS

$C_x$	: Correction factor
$G_b$	: Specific gravity of binder ('b' stands for binder)
$G_{sb}$	: Bulk specific gravity of aggregate ('s' stands for solid/aggregate, 'b' stands for bulk)
$G_{sa}$	: Apparent specific gravity of aggregate ('s' stands for solid/aggregate, 'a' for apparent)
$G_{se}$	: Effective specific gravity of aggregate ('s' stands for aggregate, 'e' for effective)
$G_{mm}$	: Maximum theoretical specific gravity of loose asphalt mix ('mm' stands for mixture, maximum)
$G_{mb}$	: Bulk specific gravity of compacted mixture ('mb' stands for mixture, bulk)
$\%G_{mm}$	: Mixture bulk density as a percentage of $G_{mm}$ (or $G_{mb}/G_{mm} * 100$ )
$h_x$	: Height after "x" number of gyrations
$h_{final}$	: Height after final/maximum number of gyrations
$N_{ini}$	: Initial number of gyrations ('ini' stands for initial)
$N_{des}$	: Design number of gyrations ('des' stands for design)
$N_{max}$	: Maximum number of gyrations ('max' stands for maximum)
$P_b$	: Percent binder, i.e., percent asphalt ('b' stands for binder)
$P_{ba}$	: Percent absorbed asphalt ('b' stands for binder, 'a' stands for absorbed)
$P_{be}$	: Effective asphalt content ('b' stands for binder, 'e' stands for effective; part <u>not</u> absorbed)
$P_s$	: Percent aggregate ('s' stands for solid/aggregate)
$S_n$	: Nominal maximum sieve size of the aggregate blend
$V_a$	: Percent air void ('a' stands for air)
VMA	: <u>V</u> oids in <u>M</u> ineral <u>A</u> ggregate
VFA	: <u>V</u> oids <u>F</u> illed with <u>A</u> spphalt

# CHAPTER I

## SUPERPAVE MIXTURE MATERIALS

### ASPHALT

The Superpave system uses a Performance Grade (PG) asphalt binder specification with a matching set of tests. The system for specifying asphalt binders is a performance-based specification. It specifies binders based on the climate and attendant pavement temperatures in which the binder is expected to serve. Physical property requirements remain the same, but the temperature at which the binder must attain the properties changes. In Superpave, binders are graded, such as PG 64-22. The first number, 64, is often called the "high-temperature grade." This means the binder would possess adequate physical properties up to 64°C. This would be the high pavement temperature corresponding to the climate the binder is expected to serve. This temperature is derived from the highest average 7-day air temperature recorded near the project site. Likewise, the second number, (-22), is often called the "low-temperature grade" and means that the binder would possess adequate physical properties in pavements down to at least -22°C. This lowest temperature is derived from the lowest air temperature recorded at that site.

Note that the design temperatures for selecting asphalt binder grades are the *pavement*, not the air temperatures. For surface layers, Superpave defines the high pavement design temperature at 20 mm below the pavement surface and the low pavement design temperature at the surface. The design pavement temperatures are obtained from air temperatures using two models for net heat flow and energy balance developed in the Superpave research.

In PG grading, additional consideration is given to the type of loading (open highway, parking area, ramps, etc.) and magnitude of loads (heavy trucks). The suggested PG binder grades are shown in Table 1.1, and Figure 1.0 shows the detailed PG binder specifications. For Kansas, typical grades range from **PG 76-28** to **PG 58-34**, depending on the project's location, reliability level chosen, and recycled materials content. Reliability is the percent probability in a single year that the actual temperature (one-day low or average seven-day high) will not exceed the design temperature- a higher reliability results in lower risk. A higher temperature range would indicate a higher reliability.

The PG binder specifications require tests on the binder in conditions corresponding to the three critical stages during the binder's performance life. Tests performed on original/virgin binders represent the first transport, storage, and handling stage. The second stage tests represent the binder during mix production and construction and are simulated by aging the binder in a rolling thin film oven (RTFO) at 163°C. The RTFO procedure exposes thin binder films to heat and air (oxidation) and approximates the oxidation of the binder during HMA production and construction. The third stage represents the binder aging over time (5 to 10 years) as part of the HMA pavement layer and is simulated by the pressure aging vessel (PAV). The PAV procedure exposes binder

samples to heat and pressure conditions (2.1 MPa and 90, 100, or 110°C, depending on the maximum weekly pavement temperature) for 20 hours to approximate in-service aging conditions. All state highway departments, including KDOT, have implemented the PG binder specifications. Table 1.2 lists the PG binder test equipment and briefly describes its use in the specifications. The following section briefly describes this test equipment and basic test principles. Details can be obtained in *Performance Graded Asphalt Binder Specification and Testing* published as Superpave Series No.1 (SP-1) by The Asphalt Institute, Lexington, Kentucky.

**Table 1.1 Superpave PG Binder Grades**

High-Temperature Grade	Low-Temperature Grade (-)
PG 46	34,40,46
PG 52	10,16,22,28,34,40,46
PG 58	16,22,28,34,40
PG 64	10,16,22,28,34,40
PG 70	10,16,22,28,34,40
PG 76	10,16,22,28,34
PG 82	10,16,22,28,34

Superpave: Today and Tomorrow

Figure 1.0 Superpave PG Asphalt Binder Specifications

The RTFO procedure requires an electrically heated convection oven. Specific oven requirements are detailed in **AASHTO T 240**, "Effect of Heat and Air on a Moving Film of Asphalt (Rolling Thin Film Oven Test)." The oven has a vertical circular carriage with holes to accommodate sample bottles. The carriage is mechanically driven and rotates about its center. The oven also contains an air jet to blow air into each sample bottle at its lowest travel position while circling in the carriage. The figure below shows a typical RTFO.

## ROLLING THIN FILM OVEN (RTFO) TEST

(Source: AI)

**Figure 1.1 RTFO Set Up**

The RTFO procedure is also used to determine the mass loss, a measure of the material vaporized by the RTFO procedure. A high mass loss value would identify a material with excessive volatiles and one that could age excessively. Mass loss is reported as the average of the two samples after RTFO aging and is calculated by:

$$\text{Mass Loss, \%} = [(\text{Original mass} - \text{Aged mass}) / \text{Original mass}] \times 100$$

The primary purpose of the RTFO procedure is to prepare aged binder materials for further testing and evaluation with the Superpave binder tests. RTFO residue should be poured from the coated bottle and not scraped. This material may be used for DSR testing, transferred into PAV pans for additional aging, or equally proportioned into small containers and stored for future use.

## PRESSURE AGING VESSEL (PAV)

Two types of pressure aging devices have been developed. The first type consisted of a stand-alone pressure aging vessel in a temperature chamber, and the second type consisted of a pressure vessel built as part of the temperature chamber. The operating principles of the equipment are the same. Specific equipment details can be found in AASHTO R28, "Accelerated Aging of Asphalt Binder Using a Pressurized Aging Vessel (PAV)." For illustrative purposes, the stand-alone vessel type is shown and described here.

**Figure 1.2 PAV**

The pressure vessel is fabricated from stainless steel and designed to operate under the test's pressure and temperature conditions (2100 kPa and either 90, 100, or 110C). It must accommodate at least 10 sample pans and does so by means of a sample rack, which is a frame that fits conveniently into the vessel. The vessel lid is secured to prevent pressure loss.

Air pressure is provided by a dry, clean, compressed cylinder with a pressure regulator, release valve, and slow-release bleed valve. The vessel lid is fitted with a pressure coupling and temperature transducer. The temperature transducer connects to a digital indicator that allows visual monitoring of internal vessel temperature throughout the aging period. Continuous temperature monitoring is required during the test.

A forced draft oven is used as a temperature chamber. The oven should be able to control the test temperature to within  $\pm 0.5^{\circ}\text{C}$  for the test duration. A digital proportional control and readout of internal vessel temperature is required.

### Specimen Preparation

To prepare for PAV, RTFO residue is transferred to individual PAV pans. The sample should be heated so that it can be readily poured and stirred to ensure homogeneity.

Each PAV sample should weigh 50 gm. Residue from approximately two RTFO bottles is usually needed for one 50 gm sample.

## ROTATIONAL VISCOMETER (RV)

Rotational viscosity is used to evaluate binders' high-temperature workability. A rotational coaxial cylinder viscometer, such as the Brookfield apparatus, is used rather than a capillary viscometer. Some asphalt technologists refer to this measure as "Brookfield Viscosity." This method of measuring viscosity is detailed in AASHTO T 316, "Viscosity Determination of Asphalt Binders Using Rotational Viscometer."

High-temperature binder viscosity is measured to ensure the asphalt is fluid enough when pumping and mixing. Consequently, according to the Superpave binder specification, rotational viscosity is measured on unaged or "tank" asphalt and must not exceed 3 Pa·s when measured at 135°C.

Figure 1.3 Rotational Viscometer

## DYNAMIC SHEAR RHEOMETER (DSR)

The Dynamic Shear Rheometer (DSR) is used to characterize the viscous and elastic behavior of asphalt binders. It does this by measuring the viscous and elastic properties of a thin asphalt binder sample sandwiched between an oscillating and a fixed plate. Operational details of the DSR can be found in AASHTO T 315, "Determining the Rheological Properties of Asphalt Binder Using a Dynamic Shear Rheometer (DSR)."

The DSR's principle of operation is straightforward. An asphalt sample is placed between an oscillating spindle and the fixed base. The oscillating plate (often called a "spindle") starts at point A and moves to point B. From point B, the oscillating plate moves back, passing point A on the way to point C. From point C, the plate moves back to point A. This movement, from A to B to C and back to A, comprises one cycle.

As the force (or shear stress,  $\tau$ ) is applied to the asphalt by the spindle, the DSR measures the response (or shear strain,  $\gamma$ ) of the asphalt to the force. The relationship between the applied stress and the resulting strain in the DSR quantifies both types of behavior. It provides information necessary to calculate two crucial asphalt binder properties: the complex shear modulus ( $G^*$  or "G star") and phase angle ( $\delta$  or "delta").  $G^*$  is the ratio of maximum shear stress ( $\tau_{\max}$ ) to maximum shear strain ( $\gamma_{\max}$ ). The time lag between the applied stress and the resulting strain is the phase angle  $\delta$ .

(Source: AI)

**Figure 1.4 DSR**

## **BENDING BEAM RHEOMETER (BBR)**

The Bending Beam Rheometer (BBR) measures the stiffness of asphalts at very low temperatures. The test uses engineering beam theory to measure the stiffness of a small asphalt beam sample under a creep load. A creep load simulates the stresses that gradually build up in a pavement when the temperature drops. Two parameters are evaluated with the BBR. *Creep stiffness* measures how the asphalt resists constant loading, and the *m-value* measures how the asphalt stiffness changes as loads are applied. The BBR test procedure details are in AASHTO T 313, "Determining the Flexural Creep Stiffness of Asphalt Binder Using the Bending Beam Rheometer (BBR)."

The critical elements of the BBR are a loading frame, controlled temperature fluid bath, computer control and data acquisition system, and test specimens. The BBR uses a blunt-nosed shaft to apply a midpoint load to the asphalt beam, which is supported at two locations. When applying the load, a load cell is mounted on the loading shaft and enclosed in an air bearing to eliminate frictional resistance. A deflection-measuring transducer is affixed to the shaft to monitor deflections. Loads are applied by pneumatic pressure, and regulators are provided to adjust the load applied to the shaft.

The temperature bath contains ethylene glycol, methanol, and water. This fluid is circulated between the test bath and a circulating bath that controls the fluid temperature to within 0.1°C. Circulation or other bath agitation must not disturb the test specimen in a manner that would influence the testing process. The data acquisition system consists of a computer (with software) connected to the BBR to control test parameters and acquire load and deflection test results.

**Figure 1.5 BBR**

### ***Overview of Procedure***

The operator initiates the control software before the test begins. Systems calibration and compliance are accomplished while the test specimens are brought to the test temperature in the bath. These include calibration of the displacement transducer and load cell. A rigid stainless steel reference beam checks the test device's compliance. The temperature transducer is also checked by using a calibrated mercury-in-glass thermometer. A thinner reference beam is also supplied to check the overall system's performance periodically. This beam is a dummy test specimen, allowing quick checks on rheometer performance. The rheometer software controls most of the system calibration, and the operator only needs to follow the instructions provided by the software.

At the end of the 60-minute thermal conditioning period, the asphalt beam is placed on the supports by gently grasping it with forceps. The operator manually applies a 2.5 to 4.5 gram ( $35 \pm 10$  mN) preload to ensure the beam is firmly in contact with the supports. A 100-gram (980 mN) seating load is automatically applied for one second by the rheometer software. After this seating, the load is automatically reduced to the preload for a 20-second recovery period. At the end of the recovery period, a 100-gram ( $980 \pm 50$  mN) load is applied to the beam for 240 seconds. The deflection of the beam is recorded during this period.

The deflection transducer monitors the movement as the applied load bends the beam. This deflection is plotted against time to determine creep stiffness and m-value. During the test, load and deflection versus time plots are continuously generated on the computer screen for the operator to observe. The test load is automatically removed at the end of 240 seconds, and the rheometer software calculates creep stiffness and m-value.

### **Data Presentation**

Beam analysis theory is used to obtain the creep stiffness of the asphalt in this test. The formula for calculating creep stiffness,  $S(t)$ , is:

$$S(t) = \frac{P \cdot L^3}{4 \cdot b \cdot h^3 \cdot \Delta(t)}$$

Where:

- $S(t)$  = creep stiffness at time,  $t = 60$  seconds
- $P$  = applied constant load, 100 g (980 mN)
- $L$  = distance between beam supports, 102 mm
- $b$  = beam width, 12.7 mm
- $h$  = beam thickness, 6.35 mm
- $\Delta(t)$  = deflection at time,  $t = 60$  seconds

Using the equation for  $S(t)$  and the deflection from the graph, the stiffness at time  $t=60$  seconds can be obtained. Creep stiffness is desired at the minimum pavement design temperature after two hours of load. However, raising the test temperature to 10C gives an equal stiffness after a 60-second loading. The obvious benefit is that a test result can be measured much shorter.

(Source: AI)

**Figure 1.6 BBR Outputs**

The second parameter needed from the bending beam test is the m-value. The m-value represents the rate of change of the stiffness,  $S(t)$ , versus time. The BBR computer also calculates this value automatically. However, the m-value is easily obtained to check the computer's results. To get the m-value, the stiffness is calculated at several loading times. These values are then plotted against time. The m-value is the slope of the log stiffness versus the log time curve at any time,  $t$ .

## DIRECT TENSION (DT) TESTER

The direct tension test measures an asphalt binder's low-temperature ultimate tensile strain. The test is performed at relatively low temperatures ranging from 0° to -36°C, the temperature range within which asphalt exhibits brittle behavior. Furthermore, the test is performed on binders aged in a rolling thin film oven and a pressure aging vessel. Consequently, the test measures the performance characteristics of binders, such as if they had been exposed to hot mixing in a mixing facility and some in-service aging. The DT test procedure details are in AASHTO T 314, "Determining the Fracture Properties of Asphalt Binder in Direct Tension (DT)."

A small dog-bone-shaped specimen is loaded in tension at a constant rate. The strain in the specimen at failure ( $F_f$ ) is the change in length ( $\Delta L$ ) divided by the effective gauge length ( $L$ ). In the direct tension test, failure is defined by the stress where the load on the specimen reaches its maximum value and not necessarily the load when the specimen breaks. Failure stress ( $\sigma_f$ ) is the failure load divided by the original cross-section of the specimen (36 mm<sup>2</sup>).

## Direct Tension Tester

$$\text{failure strain } (\epsilon_f) = \frac{\text{change in length } (\Delta L)}{\text{effective gauge length } (L_e)}$$

## ADDITIONAL REQUIREMENTS FOR PERFORMANCE-GRADED ASPHALT BINDER

Performance-graded asphalt binders (PGAB) must comply with the applicable requirements of the 2015 KDOT Standard Specifications, Section 1202 (latest revision) and AASHTO M 320, including the added requirements for polymer-modified binders, as shown in Table 1.3. All tests will be performed after adding 0.5% high molecular weight amine anti-stripping agent (by mass) to the PGAB. Additional information can be found in the 2015 KDOT Standard Specifications, Section 1201 (latest revision).

**Table 1.3 KDOT Additional Requirements for Polymer Modified Binders**

<b>Temperature Spread<sup>1</sup>, °C</b>	86	92	98	104	110
<b>Separation, ASTM D5976, °C max. Run on Original Binder</b>	2	2	2 <sup>2</sup>	2	2
<b>Elastic Recovery, ASTM D6084, Procedure A, % min. Run on RTFO Residue</b>	50	60	65	75	80

<sup>1</sup>Temperature Spread is determined by subtracting the low temperature from high temperature; for example, PG 64-28: 64-(-28)=92

<sup>2</sup>For PG 70-28 RCI, the separation test requirement is no greater than 6.

## SELECTION OF ASPHALT BINDER

The binder is selected based on the climate and traffic-loading conditions at the paving project site.

The mean and standard deviation of the yearly, 7-day-average, and maximum pavement temperature 20 mm below the surface determines the high-temperature grade. The mean and the standard deviation of the annual 1-day-minimum pavement temperature, measured at the pavement surface at the site of the paving project, were used to determine the low-temperature grade. LTPPBind software can determine these temperatures or the specifying agency may supply them. The LTPP high and low-temperature models should be selected in the software when determining the binder grade if the LTPPBind software is used. When actual site data is unavailable, representative data from the nearest weather station is used.

The “design reliability” required for the desired high and low-temperature performance is selected. Agency policy establishes the reliability of the design needed. The initial cost of the materials and the subsequent maintenance costs may influence the selection of the design reliability.

The pavement temperature data determined above are then used to select the minimum PG binder that satisfies the required design reliability.

If traffic speed or the design ESALs warrant it, the high-temperature grade is increased by the number of grade equivalents indicated by Table 1.4. This adjustment takes into account the anticipated traffic conditions at the project site. The low-temperature grade is not adjusted for traffic conditions.

If reclaimed asphalt pavement (RAP) is used in the mixture, the selected binder grade is adjusted according to Table 1.5. This adjustment is required to account for the RAP binder stiffness and quantity.

When using recycled asphalt shingles (RAS) per Section 1103 (and/or the Special Provision for Section 1103) of the KDOT Standard Specifications, the selected binder grade is adjusted for the RAS binder stiffness and quantity.

**Table 1.4 Binder Selection Based on Traffic Speed and Traffic Level**

Design ESALs <sup>1</sup> (million)	Adjustment to the High Temperature Grade of the Binder <sup>5</sup>		
	Traffic Load Rate		
	Standing <sup>2</sup>	Slow <sup>3</sup>	Standard <sup>4</sup>
< 0.3	Note 6	-	-
0.3 to < 3	2	1	-
3 to < 10	2	1	-
10 to < 30	2	1	Note 6
≥30	2	1	1

- (1) The project traffic level expected on the design lane over 20 years. Regardless of the actual design life of the roadway, determine the design ESALs for 20 years
- (2) Standing traffic - where the average traffic speed is less than 20 km/h
- (3) Slow traffic - where the average traffic speed ranges from 20 to 70 km/h
- (4) Standard traffic - where the average traffic speed is greater than 70 km/h
- (5) Increase the high-temperature grade by the number of grade equivalents indicated (one grade is equivalent to 6°C). The low-temperature grade is not adjusted for traffic conditions.
- (6) Consideration should be given to increasing the high-temperature grade by one-grade equivalent

**Table 1.5 Binder Selection Guidelines for RAP Mixtures (see footnote #2)**

Recommended Virgin Asphalt Binder Grade <sup>1</sup>	RAP Percentage
Generally, there is no change in binder selection <sup>2</sup>	≤ 15
Select virgin binder based on the type of construction, RAP origination, and location in pavement (Major Modification/1R, surface, base or shoulder lift, etc.). <sup>2</sup> <b>See footnote #2 below.</b>	16 - 25
Generally, follow recommendations from blending charts <sup>2</sup>	> 25

- (2) Contact KDOT's Bureau of Road Design (Pavement Design) section for specific details concerning RAP mixture design and/or see the Section 602 "Modified Requirements" in the project contract documents

## AGGREGATES

The Superpave system specifies two aggregate property types: **consensus** and **source**.

### ***Consensus Properties***

Consensus properties are those that a group of experts (Expert Task Group) agreed were critical in achieving high-performance HMA during SHRP research. These properties must be met at various levels depending on traffic level and position within the pavement. High traffic levels and surface mixtures (i.e., shallow pavement position) require more strict values for consensus properties. Many agencies already use these properties as quality requirements for aggregates used in HMA. These properties are:

- coarse aggregate angularity
- fine aggregate angularity
- flat or elongated particles
- clay content

### ***Coarse Aggregate Angularity***

This property *is the percent by mass of aggregates more prominent than 4.75 mm with one or more fractured faces*. It ensures a high degree of aggregate internal friction and rutting resistance. In Kansas, the Kansas Test Method KT-31, "Determination of Crushed Particles in Crushed Gravel," is used to determine this property. Table 1.6 outlines the required minimum values for coarse aggregate angularity as a function of traffic level and position within the pavement, as suggested by Superpave. KDOT has also adopted these requirements.

**Table 1.6 KDOT Requirements for Coarse Aggregate Angularity**

Traffic, million ESALs	Depth from Surface	
	≤ 100 mm	> 100 mm
< 0.3	55	50
0.3 to < 3	75	50
3 to < 10	85/80	60
10 to < 30	95/90	80/75
≥ 30	100/100	100/100
Shoulder	50	50

Note: "85/80" means that 85% of the coarse aggregate has one or more fractured faces, and 80% has two or more fractured faces.

### Fine Aggregate Angularity

This property is *the percent air voids in loosely compacted aggregates smaller than 2.36 mm*. A higher void content means more fractured faces and ensures a high fine aggregate internal friction and rutting resistance. Kansas Test Method, KT-50 "Uncompacted Void Content of Fine Aggregate," can be used to measure this property. In the test, a fine aggregate sample is poured into a small calibrated measure by flowing through a standard funnel (Figure 1.1). By determining the mass of fine aggregate ( $W$ ) in the filled measure of known volume ( $V$ ), void content can be calculated as the difference between the measured volume and fine aggregate volume collected in the measure. *Table 1.7 tabulates the KDOT required minimum values for fine aggregate angularity as a function of traffic level and position within the pavement.*

**Figure 1.8 Fine Aggregate Angularity Apparatus**

**Table 1.7 KDOT Requirements for Fine Aggregate Angularity**

Traffic, million ESALs	Depth from Surface	
	$\leq 100$ mm	$> 100$ mm
$< 0.3$	42	42
0.3 to $< 3$	42 (45*)	42
3 to $< 10$	45	42
10 to $< 30$	45	42
$\geq 30$	45	45
Shoulder	40	40
* for SM-19A Mixes <u>Note:</u> Criteria are presented as percent air voids in loosely compacted fine aggregate.		

### Flat and Elongated Particles

According to Superpave, this characteristic is the *percentage by mass of coarse aggregates* with a maximum to a minimum dimension *greater than five*. Elongated particles are undesirable because they break during construction and under traffic. The test procedure used is KT-59, "Flat and Elongated Particles in Coarse Aggregate," performed on coarse aggregate more prominent than 4.75 mm. The KDOT requirements for flat and elongated particles are shown in Table 1.8.

**Table 1.8 KDOT Requirements for Flat and Elongated Particles for HMA**

Traffic, million ESALs	Maximum, Percent
All Traffic Levels	10
Note: Criteria are presented as maximum percent by mass of flat and elongated particles.	

### Clay Content (Sand Equivalent)

*Clay content ("Sand Equivalent") is the percentage of clay material in the aggregate fraction finer than a 4.75 mm sieve.* KT-55: "Plastic Fines in Combined Aggregates by Use of the Sand Equivalent Test," derived from one specific test procedure covered in AASHTO T 176 (*air dry and mechanical shaking*) measures it. In this test, a fine aggregate sample is placed in a graduated cylinder with a flocculating solution and agitated with a mechanical shaker to loosen clayey fines and coat the aggregates. The flocculating solution forces the clayey material into suspension above the granular aggregate. After a period that allows sedimentation, the heights of suspended clay and settled sand levels are read in the graduated cylinder and noted (Figure 1.2). The sand equivalent value is computed as a ratio of the sand to clay height readings expressed as a percentage. Table 1.9 lists the current *sand equivalent* requirements of KDOT based on the project's design traffic (ESALs).

**Figure 1.9 Sand Equivalent Test**

**Table 1.9 KDOT Clay Content (Sand Equivalent) Criteria**

Traffic, million ESALs	Sand Equivalent minimum percent
< 0.3	40
0.3 to < 3	40
3 to < 10	45
10 to < 30	45
≥ 30	50
Shoulder	40

## **Source Properties**

The source properties are those agencies often use to qualify local aggregate sources. The source properties are:

- toughness
- soundness
- deleterious materials

### Toughness

*Toughness is the resistance of coarse aggregate to abrasion and degradation and is measured by the Los Angeles abrasion test (AASHTO T 96 or ASTM C131 or C535). This test estimates the mechanical degradation of aggregates during handling, construction, and in-service. It is performed by subjecting the coarse aggregate, usually larger than 2.36 mm, to impact and grinding by steel spheres. The test result is *percent loss*, the mass percentage of coarse material lost during the test due to mechanical degradation. KDOT follows AASHTO T 96, except the test sample should be prepared by removing the material passing a 0.075 mm sieve, mud or clay lumps, and sticks. The maximum permitted loss value for KDOT mixtures is 40 percent.*

### Soundness

*Soundness is the percent loss of materials from an aggregate blend during the sodium sulfate soundness test. The procedure is stated in AASHTO T 104 or ASTM C88. This test estimates the resistance of aggregate to weathering while in service. It can be performed on both coarse and fine aggregate. The test is performed by alternately exposing an aggregate sample to repeated immersions in saturated sodium or magnesium sulfate solutions, each followed by oven drying. One immersion and drying is considered one soundness cycle. During the drying phase, salts precipitate in the permeable void space of the aggregate. Upon re-immersion, the salt rehydrates and exerts expansive forces that simulate the expansive forces of freezing water. The test result is the total percent loss over various sieve intervals for a required number of cycles. Maximum loss values range from approximately 10 to 20 percent for five cycles.*

In Kansas, however, KDOT evaluates soundness with the "Soundness Test for Aggregates," as listed in Section 1115 (Test Methods for Division 1100, Aggregates) of the 2015 KDOT Standard Specifications for State Road and Bridge Construction. The minimum acceptable soundness value obtained from this test is 0.90.

### Deleterious Materials

*Deleterious materials are the mass percentage of contaminants such as shale, wood, mica, and coal in the blended aggregate. AASHTO T112 or ASTM C412 measures this property. It can be performed on both coarse and fine aggregate. Kansas has several test methods to determine amounts of different deleterious materials:*

KT-7	Clay lumps in aggregates
KT-8	Shale or "Shale like" materials in aggregate
KT-35	Sticks in aggregate

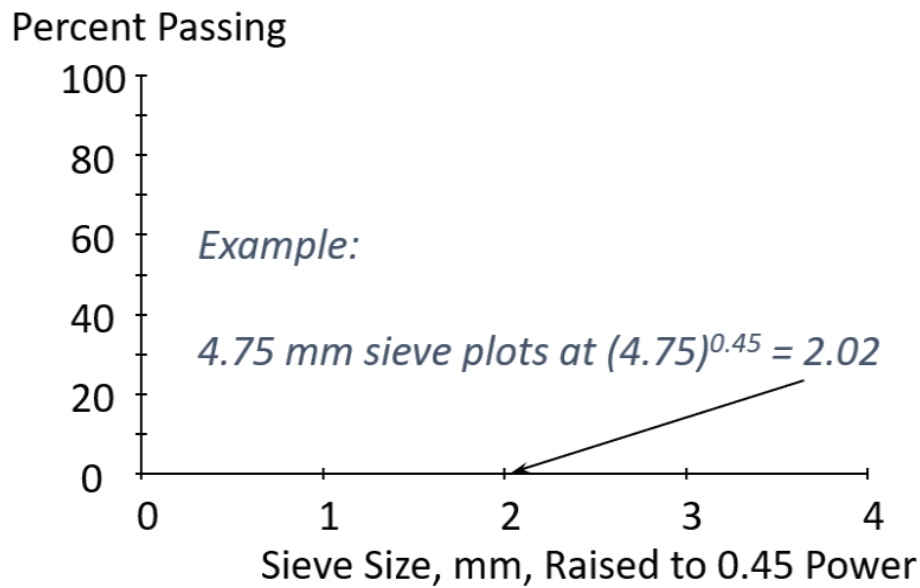

KDOT requirements for these deleterious materials are outlined in Section 1103 (Aggregates for Hot Mix Asphalt) of the 2015 KDOT Standard Specifications for State Road and Bridge Construction.

### **Other Properties**

In addition to these aggregate properties, the specific gravities of the aggregates (bulk and apparent) to be used in a mix design need to be evaluated. In Kansas, these are determined by Kansas Test Method KT-6, *Specific Gravity and Absorption of Aggregates*. KT-6 reflects testing procedures found in AASHTO T 84 and T 85.

### **Gradation**

To specify gradation, Superpave utilized a 0.45 power gradation chart to define a permissible gradation. This chart uses a unique graphing technique to judge the cumulative particle size distribution of a blend of aggregates. The ordinate of the chart is percent passing. The abscissa is an arithmetic scale of sieve size in millimeters, raised to 0.45 power. Figure 1.3 illustrates how the abscissa is scaled. In this example, the 4.75 mm sieve is plotted at 2.02, which is the sieve size raised to 0.45 power. Average 0.45 power charts do not show arithmetic abscissa labels like those in Figure 1.3. Instead, the scale is annotated with the actual sieve size, as shown in Figure 1.4. An essential feature of this chart is the maximum density gradation. This gradation plots as a straight line from the maximum aggregate size through the origin.

(Source: AI)

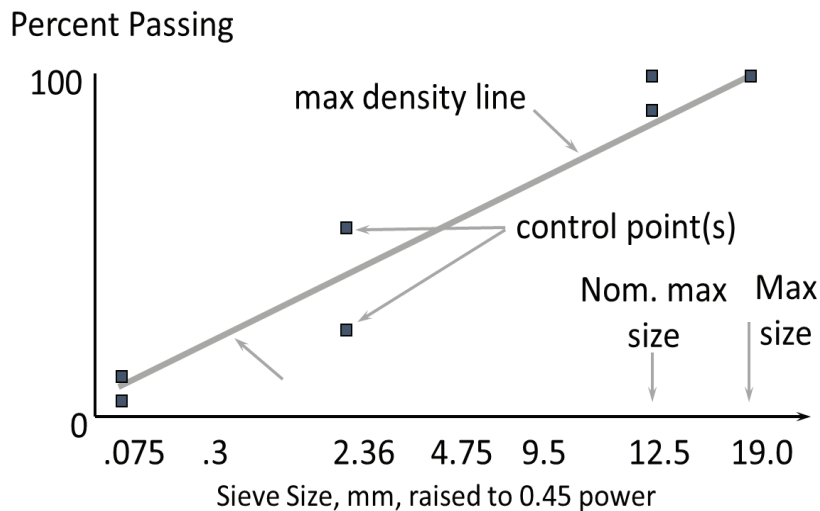

**Figure 1.10 Basis for 0.45 Power Chart**

Superpave uses the following definitions concerning aggregate size:

*Nominal Maximum Aggregate Size (NMAS):* One sieve size *larger* than the first sieve to retain more than 10 percent.

*Maximum Aggregate Size (MAS):* One sieve *larger* than the nominal maximum aggregate size.

The maximum density gradation (Figure 1.12) represents a gradation wherein the aggregate particles fit together in the densest possible arrangement. This is a gradation to avoid because there would be very little aggregate space to develop sufficiently thick asphalt films for a durable mixture. Figure 1.4 shows a 0.45 power gradation chart with a maximum density gradation for a 19 mm maximum aggregate size or 12.5 nominal maximum aggregate size.

(Source: AI)

**Figure 1.11 Maximum Density Gradation for 19-mm Maximum Aggregate Size or 12.5-mm Nominal Maximum Aggregate Size**

Control points are added to the 0.45 power chart to specify aggregate gradation. Control points function as the **master ranges** through which gradations must pass and are placed:

- maximum size
- nominal maximum size
- an intermediate size (2.36 mm or US No. 8)
- dust size (0.075 mm or US No. 200)

The **design aggregate structure** is the term used to describe the cumulative frequency distribution of aggregate particle sizes. A *design aggregate structure* lies between the control points and meets the requirements of Superpave with respect to gradation. Superpave defines six mixture gradations by their nominal maximum aggregate sizes, as shown in Table 1.10. Detailed gradations (control points) for the mixture sizes used in Kansas are shown in Appendix A. Figure 1.12 illustrates the control points for a 12.5 mm NMAS Superpave mixture. Table 1.11 lists the numerical gradation limits (% retained) for the designated Superpave mixtures for the significant modification and 1R overlay projects in Kansas, which incorporate the control points described by Superpave. KDOT includes the nominal maximum aggregate size for each mix designation; mixes ending in A (such as SR-9.5A) go above the maximum density line in the sieve sizes. Mixes ending in B or T (such as SR-9.5B or SM-9.5T) go below the maximum density line in the sieve sizes.

**Table 1.10 Superpave Mixture Sizes**

Superpave Designation	Nominal Maximum Size, mm	Maximum Size, mm
37.5 mm	37.5	50
25 mm	25	37.5
19 mm	19	25
12.5 mm	12.5	19
9.5 mm	9.5	12.5
4.75 mm	4.75	9.5

**Table 1.11 KDOT Superpave Mixture Gradations (Single Point Design Limits, % Retained) for Significant Modification and 1R Overlay Projects \***

Nominal Maximum Size Mix Designation	Percent Retained – Square Mesh Sieves								
	37.5 mm (1½" )	25.0 mm (1")	19.0 mm (¾")	12.5 mm (½")	9.5 mm (⅜")	4.75 mm (#4)	2.36 mm (#8)	1.18 mm (#16)	75 µm (#200)
SM-4.75A SR-4.75A			0	0 0-2	0-5 0-5	0-10 0-10		40-70 40-70	88-94 88-94

\* Confirm table values using Table 602-1 in Section 602 of the 2015 KDOT Standard Specifications.

## Aggregate Blending

Usually, several aggregates must be blended to produce trial blends, resulting in a *design aggregate structure*. A trial-and-error approach is generally used to determine the proportions of the individual aggregates in the blend. The basic mathematical equation for blending is:

$$\% \text{ Retained} = A * a + B * b + C * c + \dots$$

where: A, B, C, = percent retained on a given sieve for each aggregate; and  
a,b,c, = proportion (decimal fraction) of each aggregate being considered  
for use in the blend

note that:  $a + b + c + \dots = 1.0$

Table 1.12 shows the calculations for two aggregates. The table shows the required specification range and the desired (target) gradation, usually the midpoint of the specification range. A trial percentage of each aggregate source is generally assumed and multiplied by the percent retained on each sieve. These gradations are then added to get the composite percent retained on each sieve for the blend. The gradation of the blend is compared to the specification range to determine if the blend is acceptable. A spreadsheet computer program efficiently performs these calculations.

**Table 1.12 Aggregate Blending Example**

	% Retained on Sieve						
	1/2"	3/8"	#4	#8	#30	#100	#200
Specification	0	0-5	15-30	30-45	60-80	80-90	92-96
Target Gradation	0	2.5	22.5	37.5	70	85	94
Coarse Sand (A)*	0	0	2	10	29	58	81
Crushed Rock (B)*	0	6	30	51	86	98	99
30% A (a)*	0	0	0.6	3	8.7	17.4	24.3
70% B (b)*	0	4.2	21	35.7	60.2	68.6	69.3
Blend	0	4	22	38	69	86	94

\* Letters in ( ) refer to letters in the equations on the previous page

### Properties of Blended Aggregate

When two or more aggregates from different sources are blended, some of the properties of the blend can be calculated from the properties of individual aggregates. Except for specific gravity, the properties (such as angularity, absorption, strength, etc.) of the blend are the simple weighted averages of the properties of individual aggregates, as shown in the equation below:

$$X = P_1 * X_1 + P_2 * X_2 + P_3 * X_3 + \dots\dots\dots$$

where:        X = composite property of the blend  
              X<sub>1</sub>, X<sub>2</sub>, X<sub>3</sub> = properties of fractions 1, 2, and 3  
              P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub> = decimal fractions by weight of aggregates 1, 2, and 3, used in the blend

*Example Problem: Fine aggregates from two sources having fine aggregate angularity (FAA) values of 40 and 47 were blended at a ratio of 30:70 by weight, respectively. What is the FAA value of the blend?*

$$\text{Blend FAA} = 0.30 * 40 + 0.70 * 47 = 45$$

## CHAPTER II

### ASPHALT MIXTURE VOLUMETRICS

#### Introduction

*Asphalt mixture volumetrics*, or the volumetric proportions of asphalt binder and aggregate components, play a significant role in asphalt mixture behavior. Thus, a volumetric mixture design protocol was developed to consider the volumetric properties of Superpave mixtures.

The volumetric properties of a compacted paving mixture [air voids ( $V_a$ ), voids in the mineral aggregate (VMA), and voids filled with asphalt (VFA)] provide some indications of the mixture's potential pavement service performance. It is necessary to understand the definitions and analytical procedures described in this chapter to make informed decisions concerning selecting the design asphalt mixture. The information provided here applies to *paving mixtures compacted in the laboratory* and *undisturbed samples cut from a pavement* (cores/beams).

#### Terminology & Formulas

Mineral aggregate is *porous* and can absorb variable amounts of water and asphalt. Furthermore, the ratio of water to asphalt absorption varies with each aggregate. The three methods of measuring aggregate specific gravity consider these variations. These methods yield bulk, apparent, and effective specific gravities.

**Bulk Specific Gravity,  $G_{sb}$**  - *the ratio of the mass in air of a unit volume of a porous material (including both permeable and impermeable voids) at a stated temperature to the mass in air of an equal volume of gas-free distilled water at a stated temperature.* Bulk specific gravity (AASHTO T84 & T85/KT-6) is determined by measuring an aggregate sample's dry mass and bulk volume. The bulk volume includes the solid aggregate volume plus the volume of surface pores holding water (i.e., Bulk Volume = solid volume + water permeable pore volume), as shown in Figure 2.1.

**Figure 2.1 Specific Gravities of the Aggregates**

When an aggregate blend consists of separate fractions of the coarse and fine aggregates, all having different specific gravities as in the case of a compacted or loose asphalt mixture, the bulk specific gravity for the aggregate blend is calculated using the formula:

$$G_{sb} = \frac{(P_1 + P_2 + \dots + P_n)}{\left[ \frac{P_1}{G_1} + \frac{P_2}{G_2} + \dots + \frac{P_n}{G_n} \right]} \quad (2.1)$$

where:  $G_{sb}$  = bulk specific gravity for the aggregate blend  
 $P_1, P_2, \dots, P_n$  = individual percentages by mass of aggregate  
 $G_1, G_2, \dots, G_n$  = individual bulk specific gravities of aggregate

Note that:  $P_1 + P_2 + \dots + P_n = 100\%$  (for 100% virgin mixes)

*Example: What is the bulk specific gravity for the aggregate blend consisting of three different types of aggregates: CS-1: 65%, CS-2: 12%, and sand: 23%? The bulk-specific gravities for the aggregates are CS-1: 2.65, CS-2: 2.71, and sand: 2.69.*

$P_1 = 65$      $P_2 = 12$      $P_3 = 23$   
 $G_1 = 2.65$      $G_2 = 2.71$      $G_3 = 2.69$

$$G_{sb} = \frac{(65 + 12 + 23)}{\left[ \frac{65}{2.65} + \frac{12}{2.71} + \frac{23}{2.69} \right]}$$

$$G_{sb} = 2.666$$

**Apparent Specific Gravity,  $G_{sa}$**  - the ratio of the mass in air of an impermeable material unit volume at a stated temperature to the mass in air of an equal volume of gas-free distilled water at a stated temperature. Apparent specific gravity (also measured using KT-6) is determined by measuring an aggregate sample's dry mass and apparent volume. The apparent volume only includes the volume of the solid aggregate. It does not include the volume of any surface pores (i.e., apparent volume = volume of solid aggregate particles), as shown in Figure 2.1.

**Effective Specific Gravity,  $G_{se}$**  - the ratio of the mass in air of a unit volume of a porous material (excluding voids permeable to asphalt) at a stated temperature to the mass in air of an equal volume of gas-free distilled water at a stated temperature. In the context of bulk and apparent specific gravity, it includes the dry mass of aggregate and the effective volume of the aggregate. The effective volume includes solid aggregate volume and surface pores filled with water but not asphalt, as illustrated in Figure 2.1. The effective specific gravity can be approximated as (bulk specific gravity + apparent specific gravity)/2, or when the maximum specific gravity of a paving mix,  $G_{mm}$ , as measured by AASHTO T209/KT-39, is known, it can be computed from the following formula:

$$G_{se} = \frac{(100 - P_b)}{\left[ \frac{100}{G_{mm}} - \frac{P_b}{G_b} \right]} \quad (2.2)$$

*Example: Find the Effective Specific Gravity ( $G_{se}$ ) value for a Superpave aggregate mix with 4% Asphalt content (Asphalt Binder Specific Gravity: 1.03) and a maximum theoretical specific gravity of 2.535.*

$$G_{se} = \frac{(100 - 4)}{\left[ \frac{100}{2.535} - \frac{4}{1.03} \right]} \quad (2.3)$$

$$G_{se} = 2.699$$

### **Effective Specific Gravity ( $G_{se}$ ) of Reclaimed Asphalt Pavement (RAP):**

The effective specific gravity of RAP is needed to estimate the bulk specific gravity,  $G_{sb}$ , of RAP and can be obtained from the following formula:

$$G_{se} = \frac{P_{mm} - P_b}{\left[ \frac{P_{mm}}{G_{mm}} \right] - \left[ \frac{P_b}{G_b} \right]} \quad (2.4)$$

where:

- $G_{se}$  = effective specific gravity of RAP
- $P_{mm}$  = total loose mixture = 100%
- $P_b$  = asphalt, percent by total weight of mixture (*obtained by burning asphalt in RAP using KT-57*)
- $G_{mm}$  = maximum specific gravity of RAP (no air voids) (KT-39)
- $G_b$  = Specific gravity of the asphalt in the RAP (1.035 estimated)

*The Superpave volumetric mix design will use two specific gravities of the asphalt mixture: the maximum theoretical specific gravity of loose asphalt mix ( $G_{mm}$ ) and the bulk specific gravity of compacted mix ( $G_{mm}$ ).*

**Maximum Theoretical Specific Gravity of loose asphalt mix,  $G_{mm}$**  - *the ratio of the mass of a given volume of HMA with no air voids to the mass of an equal volume of water, both at the same temperature.* This specific gravity of a loose asphalt mixture, also known as *Rice Specific Gravity*, can be determined by AASHTO T209/KT-39 or can be estimated from the following formula for a given mix:

$$G_{mm} = \frac{100}{\left[ \frac{P_s}{G_{se}} + \frac{P_b}{G_b} \right]} \quad (2.5)$$

where:

- $G_{mm}$  = maximum theoretical specific gravity
- $G_{se}$  = effective specific gravity of the aggregate blend
- $G_b$  = specific gravity of the asphalt
- $P_s$  = percentage of aggregate (= 100 -  $P_b$ )
- $P_b$  = percent asphalt (total mixture basis)

*Example: Compute the Maximum Theoretical Specific Gravity ( $G_{mm}$ ) for a bituminous mix of 96% aggregates and 4% asphalt (asphalt binder specific gravity = 1.03). The effective specific gravity of the asphalt mix is 2.699.*

$$G_{se} = 2.699 \quad G_b = 1.03 \quad P_b = 4\% \quad P_s = (100 - P_b) = (100 - 4) = 96\%$$

$$G_{mm} = \frac{100}{\left[ \frac{96}{2.699} + \frac{4}{1.03} \right]}$$

$$G_{mm} = 2.535$$

**Compacted Mixture Bulk Specific Gravity ( $G_{mb}$ )** - *the ratio of the mass of a given volume of HMA to the mass of an equal volume of water, both at the same temperature.* The knowledge of bulk specific gravity of a compacted asphalt mix ( $G_{mb}$ ) is essential for computing specific volumetric parameters, such as *percent air voids*. This specific gravity can be determined using AASHTO T166 (Method A)/KT-15 (Procedure III) and is expressed as:

$$G_{mb} = A / (B - C) \quad (2.6)$$

Where:

- A = Mass of dry specimen in air, g.
- B = Mass of the saturated, surface dry (SSD) specimen in air after 4 minutes in water, g.
- C = Mass of saturated specimen in water, g.

*Example: Find the bulk specific gravity of a compacted asphalt mixture specimen from the following data:*

Mass of dry specimen in air, A = 4,847g  
 Mass of SSD specimen in air after 4 minutes in water, B = 4,875g  
 Mass of SSD specimen in water, C = 2,890g

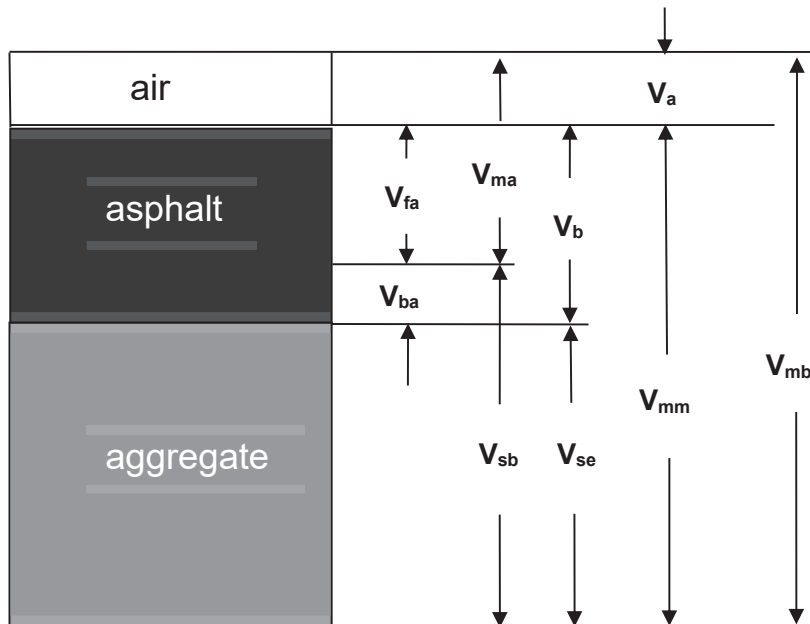

$$G_{mb} = 4847 / (4875 - 2890) = 2.442$$

The definitions for voids in the mineral aggregate (VMA), air voids ( $V_a$ ), voids filled with asphalt (VFA), and effective asphalt content ( $P_{be}$ ) are:

**Voids in the Mineral Aggregate, VMA** - *the volume of intergranular void spaces between the aggregate particles of a compacted paving mixture that includes the air voids and the effective asphalt content, expressed as a percent of the total volume of the sample.* The volume fractions are shown in Figure 2.2.

VMA can be computed using the following formula:

$$VMA = 100 - \left[ \frac{(G_{mb} P_s)}{G_{sb}} \right] \quad (2.7)$$

- $V_{ma}$  = Volume of voids in mineral aggregate  
 $V_{mb}$  = Bulk volume of compacted mix  
 $V_{mm}$  = Voidless volume of paving mix  
 $V_{fa}$  = Volume of voids filled with asphalt  
 $V_a$  = Volume of air voids  
 $V_b$  = Volume of asphalt  
 $V_{ba}$  = Volume of absorbed asphalt  
 $V_{sb}$  = Volume of mineral aggregate (by bulk specific gravity)  
 $V_{se}$  = Volume of mineral aggregate (by effective specific gravity)

**Figure 2.2 Volume Fractions of a Compacted Asphalt Concrete Mix**

*Example: Find the VMA value using previously obtained  $G_{mb}$  and  $G_{sb}$  values for a mix with 4% asphalt content (i.e.,  $(100-4)=96\%$  aggregate,  $P_s$ ).*

$$VMA = 100 - \left[ \frac{2.442 \times 96}{2.666} \right]$$

$$VMA = 12.07 \%$$

**Percent Absorbed Asphalt,  $P_{ba}$**  - the portion of asphalt absorbed into the aggregate and can be computed as:

$$P_{ba} = \frac{(100 G_b)(G_{se} - G_{sb})}{(G_{sb} G_{se})} \quad (2.8)$$

*Example: Find the  $P_{ba}$  for the previously obtained data.*

$$P_{ba} = \frac{(100 \times 1.03)(2.699 - 2.666)}{(2.699 \times 2.666)}$$

$$P_{ba} = 0.5\%$$

**Effective Asphalt Content,  $P_{be}$**  - the total asphalt content of a paving mixture minus the portion of asphalt absorbed into the aggregate particles:

$$P_{be} = P_b - \left[ \frac{(P_{ba} \times P_s)}{100} \right] \quad (2.9)$$

*Example: Find the value of  $P_{be}$  for the previously obtained data.*

$$P_{be} = 4.0 - \left[ \frac{(0.5 \times 96)}{100} \right] \quad (2.10)$$

$$P_{be} = 3.52\%$$

**Air Voids,  $V_a$**  - the total volume of the small pockets of air between the coated aggregate particles throughout a compacted paving mixture, expressed as a percent of the bulk volume of the compacted paving mixture and can be computed from the following formula:

$$V_a = 100 \times \left[ \frac{(G_{mm} - G_{mb})}{G_{mm}} \right] \quad (2.11)$$

*Example: Find the percent air void for the previously computed  $G_{mm}$  and  $G_{mb}$  values.*

$$V_a = 100 \times \left[ \frac{(2.535 - 2.442)}{2.535} \right]$$

$$V_a = 3.7\%$$

**Voids Filled with Asphalt, VFA** - the percentage portion of the volume of intergranular void space between the aggregate particles occupied by the effective asphalt. It is expressed as the ratio of (VMA -  $V_a$ ) to VMA, as shown below:

$$VFA = 100 \times \left[ \frac{VMA - V_a}{VMA} \right] \quad (2.12)$$

*Example: Find the VFA value for previously computed VMA and percent air void values.*

$$VFA = 100 \times \left[ \frac{12.07 - 3.7}{12.07} \right]$$

$$VFA = 69.3\%$$

In Superpave data analysis, *voids in the mineral aggregate (VMA)* and *air voids ( $V_a$ )* are expressed as percent by volume of the paving mixture. *Voids filled with asphalt (VFA)* are the percentage of VMA filled by the effective asphalt. *Depending on how asphalt content is specified, the effective asphalt content may be expressed as percent by mass of the total mass of the paving mixture or as percent by mass of the aggregate in the paving mixture.*

Because air voids, VMA, and VFA are volume quantities and cannot be weighed, a paving mixture must first be designed or analyzed on a **volume basis**. This volume approach can easily be changed to a mass basis for design purposes to provide a job-mix formula.

## Superpave Volumetric Asphalt Mixture Design Requirements

The asphalt mixture design requirements in the Superpave volumetric method consist of the following:

- Mixture volumetric requirements
- Compactibility requirements
- Dust proportion (*Dust-to-Binder Ratio*)
- Moisture susceptibility

Specified values for these parameters are applied during the Superpave volumetric mixture design phase.

### Mixture Volumetric Requirements

Mixture volumetric requirements consist of air voids ( $V_a$ ), voids in the mineral aggregate (VMA), and voids filled with asphalt (VFA). Air void content is essential because it is used as the basis for asphalt binder content selection. In all cases, the design air void content is **four percent\***. VMA requirements are a function of the maximum nominal aggregate size of the mixture. VFA requirements are a function of traffic level (design ESALs). VMA and VFA requirements in Superpave will be discussed in detail in the next chapter.

*\*Currently, KDOT requires 3% air voids*

### Compactibility Requirements

These requirements are based on %  $G_{mm}$  obtained during gyratory compaction of the Superpave samples at  $N_{ini}$  and  $N_{max}$  levels of gyration. % $G_{mm}$  at the  $N_{ini}$  level is a function of traffic level (design ESALs), and % $G_{mm}$  at the  $N_{max}$  level is capped at less than 98% maximum. *Currently, KDOT requires the % $G_{mm}$  at the  $N_{ini}$  level than the percent of the  $G_{mm}$  shown in the Contract Special Provision and % $G_{mm}$  at the  $N_{max}$  level shall be a maximum of 98.5%.*

### Dust Proportion (Dust-to-Binder Ratio)

Dust proportion, also known as the dust-to-binder ratio, is an indicator of the amount of material passing 75  $\mu\text{m}$  (U.S. No. 200) sieve ( $P_{0.075}$ ) with respect to the effective asphalt content ( $P_{be}$ ) and computed using the following formula:

$$DP = \left[ \frac{P_{0.075}}{P_{be}} \right] \quad (2.13)$$

An acceptable dust proportion ranges from **0.6 to 1.2**, **0.8 to 1.6**, or **0.9 to 2.0** depending upon mixture type and size (see *Table 602-1 in the Special Provision to Section 602 of the 2015 KDOT Standard Specifications (latest revision)*).

### Moisture Susceptibility

The test used to evaluate Superpave HMA for moisture susceptibility, or stripping, in Kansas is *Kansas Test Method KT-56: Resistance of Compacted Asphalt Mixtures to Moisture Induced Damage*. This test is not a performance-based test. It serves two purposes. *First*, it identifies whether an asphalt-aggregate mixture is moisture-susceptible. *Second*, it measures the effect of anti-stripping additives. In this test, two subsets of test specimens with  $7 \pm 0.5\%$  air voids are produced from a loose mixture at **design asphalt content** found in the volumetric mixture design. One set is kept at room temperature. The other set is subjected to water conditioning. After conditioning, both subsets are tested for indirect tensile strength at 25°C. The test result reported is the ratio of the average tensile strength of the conditioned subset to that of the unconditioned subset. This ratio is called the "tensile strength ratio," or TSR. *Superpave requires a minimum TSR of 0.8 (80 percent); KDOT follows this requirement.*

### **Steps in the Analysis of a Compacted Paving Mixture**

The measurements and calculations needed for a void analysis are:

- (a) Measure the bulk-specific gravities of the coarse aggregate (AASHTO T85/KT-6) and of the fine aggregate (AASHTO T84/KT-6) or use the value determined via 3-way split analysis and/or published value.
- (b) Measure the specific gravity of the asphalt binder (AASHTO T228 or ASTM D70) (usually obtained from the asphalt binder supplier).
- (c) Calculate the aggregate blend's bulk specific gravity ( $G_{sb}$ ) in the paving mixture.
- (d) Measure the maximum specific gravity ( $G_{mm}$ ) of the loose paving mixture (AASHTO T 209/KT-39).
- (e) Measure the bulk specific gravity ( $G_{mb}$ ) of the compacted paving mixture (AASHTO T 166/KT-15).
- (f) Calculate the aggregate blend's effective specific gravity ( $G_{se}$ ).
- (g) Calculate the maximum specific gravity ( $G_{mm}$ ) at other asphalt contents.
- (h) Calculate the asphalt absorption ( $P_{ba}$ ) of the aggregate.
- (i) Calculate the paving mixture's effective asphalt content ( $P_{be}$ ).
- (j) Calculate the percent voids in the compacted paving mixture's mineral aggregate (VMA).
- (k) Calculate the percent air voids ( $V_a$ ) in the compacted paving mixture.
- (l) Calculate the percent voids filled with asphalt (VFA) in the compacted paving mixture.

## CHAPTER III

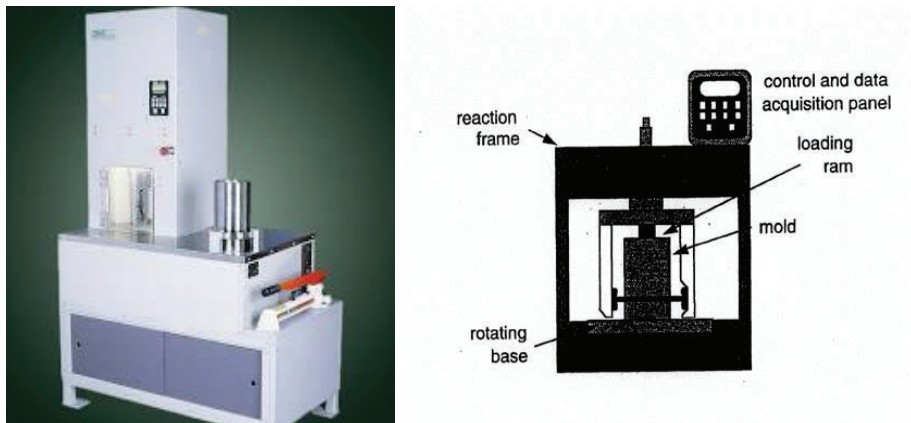

### SUPERPAVE GYRATORY COMPACTION

#### Introduction

The Superpave mixture design and analysis uses the Superpave gyratory compactor (SGC) to realistically compact loose mixture specimens to densities achieved under actual pavement climatic and loading conditions.

#### Test Equipment

The SGC is an electrohydraulic device with the following system components: reaction frame, rotating base and motor, loading system, loading ram and pressure gauge, height measuring and recording system, and mold assembly. The Pine AFGC125X SGC, shown in Figure 3.1, is referenced throughout this manual

**Figure 3.1 Superpave Gyratory Compactor (SGC) [Pine AFGC125X illustrated]**

The reaction frame provides a non-compliant structure against which the loading ram can push while compacting specimens. The base of the SGC rotates and is affixed to the loading frame. It supports the mold while compaction occurs. Reaction bearings are used to position the mold at an internal angle of  **$1.16 \pm 0.02$  degrees**, which is the compaction angle of the SGC. The electric motor drives the rotating base at a constant speed of  **$30 \pm 0.5$  revolutions per minute** and furnishes power to the hydraulic system. A hydraulic or mechanical system applies a load to the loading ram, which imparts  **$600 \pm 18$  kPa compaction pressure** to the specimen. The loading ram diameter nominally matches the inside diameter of the mold, which is usually 150 mm. A pressure gauge with digital signal conditioning measures the ram pressure during compaction. As the specimen densifies during compaction, the pressure gauge signals the hydraulic system to adjust the position of the loading ram so that a constant compaction pressure is maintained.

Specimen height measurement is an essential function of the SGC. By knowing the mass of material placed in the mold, the diameter of the mold, and the specimen height, specimen density can be estimated at any time throughout the compaction process. Density is computed by dividing the mass by the volume of the specimen. The specimen volume is calculated as the volume of a cylinder with a diameter of 150 mm and the measured height. Height is recorded using a *Linear Variable Differential Transformer* (LVDT) (or equivalent) that records the position of the ram before and during the test. The vertical change in ram position identically equals the change in specimen height. The specimen height vs. the number of gyrations is available through a serial port connection, which may be connected to a personal computer, printer, or other device to record height (i.e., density) measurements throughout the compaction process. This method develops a compaction characteristic as the specimen is compacted (Figure 3.2).

(Source: AI)

**Figure 3.2 Compaction Characteristic of SGC**

The SGC uses a cast steel mold (Figure 3.3) with a diameter of 150 mm and a nominal height of 250 mm. A base plate fits in the bottom of the mold to allow specimen confinement during compaction.

**Figure 3.3 SGC Mold Configuration and Compaction Parameters**

### Specimen Preparation

Compaction specimens must be mixed and compacted under equi-viscous temperature conditions corresponding to  $0.170 \pm 0.02$  Pa·s and  $0.280 \pm 0.03$  Pa·s, respectively. Figure 3.4 shows a typical temperature-viscosity chart for an asphalt binder. A mechanical mixer accomplishes mixing. After mixing in the lab, loose test specimens are subjected to **2 hours +/- 5 minutes** of short-term aging in a forced draft oven maintained at the **compaction temperature**. The compaction molds and base plates should also be placed in an oven at **compaction temperature** for at least 30 to 45 minutes before use.

(Source: AI)

**Figure 3.4 Typical Temperature-Viscosity Relationship**

## Selection of Design Aggregate Structure

One of the preliminary steps in Superpave mixture design is selecting the design aggregate structure. Trial blends are established by mathematically combining the gradations of individual aggregates into a single gradation. The blend gradation is then compared to the specification control requirements for the appropriate sieves, as Superpave requires.

At a minimum, three trial blends must be evaluated—one coarse, one fine, and one intermediate. Once trial blends are selected, a preliminary evaluation of the blended aggregate properties is necessary. This includes the four consensus properties, the aggregates' bulk and apparent specific gravities, and source aggregate properties. These values are *mathematically* combined from the individual aggregate properties.

After the aggregate properties have been evaluated, the next step is to compact specimens and determine the initial volumetric properties of each trial blend. However, this requires estimating the trial (initial) binder (asphalt) content.

## Estimation of Trial (Initial) Binder Content

The trial (initial) binder content is estimated from the knowledge of effective specific gravity and absorption of the aggregate blend. This trial binder content is then calculated as described in *Superpave Level I Mix Design*, published as Superpave Series No. 2 (SP-2) by The Asphalt Institute, Lexington, Kentucky or AASHTO Standard Practice, AASHTO Designation R 35, *Superpave Volumetric Design for Hot-Mix Asphalt (HMA)*. The following procedure can be followed to estimate the trial binder content for each aggregate blend:

The **effective specific gravity ( $G_{se}$ )** of the blend is estimated using the equation:

$$G_{se} = G_{sb} + 0.8 * (G_{sa} - G_{sb}) \quad (3.1)$$

where:

- $G_{se}$  = effective specific gravity of the aggregate blend
- $G_{sb}$  = bulk specific gravity of the aggregate blend
- $G_{sa}$  = apparent specific gravity of the aggregate blend

The multiplier, 0.8, can be changed at the designer's discretion. Absorptive aggregates may require values closer to 0.6 or 0.5.

The **volume of asphalt binder absorbed into the aggregates ( $V_{ba}$ )** is estimated from the equation:

$$V_{ba} = \frac{P_s \times (1 - V_a)}{\left[ \frac{P_b}{G_b} + \frac{P_s}{G_{se}} \right]} \times \left[ \frac{1}{G_{sb}} - \frac{1}{G_{se}} \right] \quad (3.2)$$

where:  $V_{ba}$  = volume of absorbed binder,  $\text{cm}^3/\text{cm}^3$  of mix  
 $P_b$  = percent of binder (assumed 0.05),  
 $P_s$  = percent of aggregate (assumed 0.95),  
 $G_b$  = specific gravity of binder (assumed 1.02, *if not known*),  
 $V_a$  = volume of air voids (assumed  $0.04 \text{ cm}^3/\text{cm}^3$  of mix)

The **volume of the effective binder ( $V_{be}$ )** is then determined as:

$$V_{be} = 0.176 - 0.0675 \cdot \log(S_n) \quad (3.3)$$

where:  $S_n$  = the nominal maximum sieve size of the aggregate blend (in mm)

Finally, the **trial (initial) asphalt binder ( $P_{bi}$ ) content** is calculated from the equation:

$$P_{bi} = \frac{G_b \times (V_{be} + V_{ba})}{(G_b \times (V_{be} + V_{ba})) + W_s} \times 100 \quad (3.4)$$

where:  $P_{bi}$  = percent of binder by mass of mix, and  
 $W_s$  = mass of aggregate, grams, from the equation below:

$$W_s = \frac{P_s \times (1 - V_a)}{\left[ \frac{P_b}{G_b} + \frac{P_s}{G_{se}} \right]} \quad (3.5)$$

Using the SGC, a minimum of two specimens for each trial blend are compacted. Two different asphalt mixture quantities are needed. For specimens to be used in the volumetric design, the sufficient mix must be compacted to achieve a specimen 150 mm in diameter by approximately 115 mm in height. Each specimen requires approximately 4,500 grams of aggregate. At least one loose sample should be prepared to obtain a maximum theoretical specific gravity using AASHTO T209/KT-39. Approximately 2,000 grams of aggregate are needed for one sample in this test.

## Overview of Procedure

After short-term aging (lab-produced mix only) for **2 hours at compaction temperature** in the oven, the loose test specimens are ready for compaction. The compactor is initiated by turning on its main power. The vertical pressure is set at **600 kPa**. The gyration counter should be set to the desired number of gyrations. Three gyration levels are of interest:

- initial number of gyrations ( $N_{ini}$ )
- design number of gyrations ( $N_{des}$ )
- maximum number of gyrations ( $N_{max}$ )

Test specimens are compacted using  $N_{max}$  gyrations. The relationship between  $N_{ini}$ ,  $N_{des}$ , and  $N_{max}$  are:

$$\text{Log } N_{max} = 1.10 \text{ Log } N_{des} \quad (3.6)$$

$$\text{Log } N_{ini} = 0.45 \text{ Log } N_{des} \quad (3.7)$$

The design number of gyrations ( $N_{des}$ ) is a function of the project traffic level (20-year design ESALs). The values for  $N_{des}$  are shown in the Table 3.1 and range from 50 to 125. The contract documents for a KDOT project will have the  $N_{des}$ ,  $N_{ini}$ , and  $N_{max}$  values for that project determined from the design traffic level.

After the base plate is in place, a paper disk is placed on top of the plate, and the mold is charged using a single lift. The top of the uncompacted specimen should be slightly rounded. The mix is to be at the midpoint of the established binder compaction temperature range. A paper disk is placed on top of the mixture, followed by the top plate.

The mold is placed in the compactor on the rollers. After the machine is started, the ram is automatically lowered until it contacts the mixture and the resisting pressure is **600 kPa**. The angle of gyration (**1.16 degrees internal**) is also automatically applied, and the compaction process begins. The base rotates at a rate of **30 revolutions per minute**. The height of the specimen corresponding to each gyration is recorded. When  $N_{max}$  has been reached, the compactor automatically ceases. After the angle and pressure are released, the mold containing the compacted specimen is removed from the compaction chamber. After a suitable cooling period, the specimen is extruded from the mold.

**Table 3.1 Gyrotory Compaction Efforts in Superpave Volumetric Mix Design**

20-year Design ESALs (millions)		Compaction Parameter		
		<b>N<sub>ini</sub></b>	<b>N<sub>des</sub></b>	<b>N<sub>max</sub></b>
< 0.3 ***		6	50	75
0.3 - <3 ***		7	75	115
3 - <30		8	100	160
> 30		9	125	205
Shoulder *	A	6	50	75
	B	**	**	**

(\*) At the contractor's option, A or B may be used

(\*\*) Use traveled way design properties

(\*\*\*) Some projects may use N<sub>ini</sub> = 6 & N<sub>des</sub> = 60 with no N<sub>max</sub> requirement

The bulk specific gravity of the compacted test specimen is measured using KT-15 (Proc. III)/AASHTO T 166 (Method A). The maximum theoretical specific gravity of the loose mix is determined using KT-39 / AASHTO T 209. The designer can then calculate the volumetric parameters and other mix properties.

### Data Analysis and Presentation

Superpave gyratory compaction data is analyzed by computing the estimated bulk specific gravity, corrected bulk specific gravity, and corrected percentage of maximum theoretical specific gravity (% G<sub>mm</sub>) for each desired level of gyration. During compaction, the height is measured and recorded after each gyration. An estimate of G<sub>mb</sub> at any value of gyration is made by dividing the mass of the mixture by the volume of the compaction mold:

$$G_{mb}(estimated) = \frac{W_{mx} / V_{mx}}{Y_w} \quad (3.8)$$

where:      G<sub>mb</sub> (estimated) = estimated bulk specific gravity of specimen during compaction  
                  W<sub>mx</sub>                = mass of specimen, grams  
                  Y<sub>w</sub>                    = density of water = 1 gm/cc  
                  V<sub>mx</sub>                    = volume of compaction mold (cc), calculated

using the equation below:

$$V_{mx} = \frac{\pi d^2 h_x}{4} \times 0.001 \text{ cm}^3 / \text{mm}^3 \quad (3.9)$$

where: d = diameter of mold (150 mm)  
h<sub>x</sub> = height of specimen in mold during compaction (mm)

This calculation assumes that the specimen is a smooth-sided cylinder, which is not true. Surface irregularities cause the volume of the specimen to be slightly less than the volume of a smooth-sided cylinder. Therefore, *the final estimated G<sub>mb</sub> at N<sub>max</sub> differs from the measured G<sub>mb</sub> at N<sub>max</sub>*. The estimated G<sub>mb</sub> is then corrected by a ratio of the measured to estimated bulk-specific gravity:

$$C = \frac{G_{mb}(\text{measured})}{G_{mb}(\text{estimated}, \text{final})} \quad (3.10)$$

where: C = correction factor  
G<sub>mb</sub> (measured) = measured bulk specific gravity (after N<sub>max</sub>)  
G<sub>mb</sub> (estimated) = estimated bulk specific gravity at N<sub>max</sub>

The estimated G<sub>mb</sub> at any other gyration level is then determined using.

$$G_{mb}(\text{corrected}) = C \times G_{mb}(\text{estimated}) \quad (3.11)$$

where: G<sub>mb</sub> (corrected) = corrected bulk specific gravity of the specimen at any gyration  
C = correction factor  
G<sub>mb</sub> (estimated) = estimated bulk specific gravity at any gyration

Alternately, the corrected bulk specific gravity, G<sub>mb</sub> (corrected), of a specimen at any level of gyration (x) can be computed as:

$$G_{mb}(\text{corrected}) = G_{mb}(\text{measured}) \times \frac{h_{\text{final}}}{h_x} \quad (3.12)$$

The percent G<sub>mm</sub> at any gyration level is then calculated as the ratio of G<sub>mb</sub> (corrected) to G<sub>mb</sub> (measured), and the average percent G<sub>mm</sub> value for the two companion specimens can be obtained.

$$\% G_{mm} = G_{mb}(\text{corrected}) / G_{mb}(\text{measured}) \times 100 \quad (3.13)$$

Using the  $N_{ini}$ ,  $N_{des}$ , and  $N_{max}$  gyration levels previously determined from the design traffic level for a particular project (Table 3.1), the Superpave volumetric mix design criteria (VMA, VFA, and dust proportion) are established at a **four percent (4%) (currently 3% in Kansas)** air void content at  $N_{des}$ . Volumetric mix design also specifies criteria for the mix density ( $\%G_{mm}$ ) at  $N_{ini}$  and  $N_{max}$ .

The **percentage of air voids ( $V_a$ )** at  $N_{des}$  is determined from the equation:

$$V_a = 100 - \%G_{mm} @ N_{des} \quad (3.14)$$

where:  $V_a$  = percent air voids @  $N_{des}$   
 $\%G_{mm} @ N_{des}$  = maximum theoretical specific gravity @  $N_{des}$ , percent

The **percent voids in the mineral aggregate (VMA)** at  $N_{des}$  is calculated using:

$$\%VMA = 100 - \left[ \frac{\%G_{mm} @ N_{des} \times G_{mm} \times P_s}{G_{sb}} \right] \quad (3.15)$$

where: VMA = voids in mineral aggregate, percent  
 $\%G_{mm} @ N_{des}$  = maximum theoretical specific gravity @  $N_{des}$ , percent  
 $G_{mm}$  = maximum theoretical specific gravity  
 $G_{sb}$  = bulk specific gravity of total aggregate  
 $P_s$  = aggregate content,  $\text{cm}^3/\text{cm}^3$  by total mass of mixture

The **percent voids filled with asphalt (VFA)** at  $N_{des}$  is calculated using:

$$\%VFA = 100 \times \left[ \frac{\%VMA @ N_{des} - V_a @ N_{des}}{\%VMA @ N_{des}} \right] \quad (3.16)$$

Suppose the air voids percentage equals four percent (4%). In that case, the data calculated above is compared to the volumetric criteria, and the analysis of this blend is complete. However, if the air void content at  $N_{des}$  varies from four percent (*and this will typically be the case*), an estimated asphalt content to achieve 4 percent air voids at  $N_{des}$  is determined, and the estimated volumetric properties at this estimated design asphalt content are calculated. Similar calculations can also be done for 3% air voids.

The **estimated asphalt content at  $N_{des}$  for 4% air voids** is calculated using this equation:

$$P_{b,estimated} = P_{bi} - (0.4 \times (4.0 - V_a)) \quad (3.17)$$

where:  $P_{b,estimated}$  = estimated asphalt content, percent by mass of mixture  
 $P_{bi}$  = trial (initial) asphalt content, percent by mass of the mixture  
 $V_a$  = percent air voids at  $N_{des}$  (trial)

The volumetric properties (VMA and VFA) at  $N_{des}$  and mixture density at  $N_{ini}$  and  $N_{max}$  are then estimated at this asphalt binder content using the equations described below:

For **estimated VMA at  $N_{des}$  for 4% air voids**:

$$\%VMA_{estimated} = \%VMA_{initial} + C_1 \times (4.0 - V_a) \quad (3.18)$$

where:  $\%VMA_{initial}$  = %VMA from trial asphalt binder content  
 $C_1$  = constant use 0.1 if  $V_a$  is less than 4.0 percent  
use 0.2 if  $V_a$  is greater than 4.0 percent

Table 3.2 shows specified minimum values for VMA, a function of the nominal maximum aggregate size.

For **estimated VFA at  $N_{des}$  for 4% air voids**:

$$\%VFA_{estimated} = 100 \times \frac{(\%VMA_{estimated} - 4.0)}{\%VMA_{estimated}} \quad (3.19)$$

Table 3.3 shows the acceptable range of design VFA at four percent air voids as a function of design traffic level.

**Table 3.2 Superpave VMA Requirements**

Nominal Maximum Aggregate Size	Minimum VMA, percent
4.75 mm	16.0
9.5 mm	15.0
12.5 mm	14.0
19 mm	13.0
25 mm	12.0
37.5 mm	11.0

**Table 3.3 Superpave VFA Requirements**

20-year Design ESALs (millions)	Design VFA, percent
<0.3	66-80
0.3 - <3	65-78
3 - <30	65-76
>30	65-76
Shoulder	66-80

For %G<sub>mm</sub> at N<sub>ini</sub> corresponding to 4% air voids at N<sub>des</sub> :

$$\%G_{mm \text{ estimated @ } N_{ini}} = \%G_{mm \text{ trial @ } N_{ini}} - (4.0 - V_a) \quad (3.20)$$

*The maximum allowable mixture density at N<sub>ini</sub> (%G<sub>mm</sub> at N<sub>ini</sub>) will be shown in Table 3.4. The Contract Special Provision will show the %G<sub>mm</sub> at N<sub>ini</sub> requirements for the KDOT projects.*

**Table 3.4 Superpave %G<sub>mm</sub> at N<sub>ini</sub> Requirements**

20-year Design ESALs (millions)	% G <sub>mm</sub> at N <sub>ini</sub>	
	≤100 mm <sup>1</sup>	>100 mm <sup>1</sup>
<0.3	≤ 91.5	≤ 91.5
0.3 to <3	≤ 90.5	≤ 90.5
3 to <10	≤ 89.0	≤ 90.5
10 to <30	≤ 89.0	≤ 90.0
>30	≤ 89.0	≤ 89.0
Shoulder	≤ 91.5	≤ 91.5

(1) Depth from surface

For %G<sub>mm</sub> at N<sub>max</sub> corresponding to 4% air voids at N<sub>des</sub> :

$$\%G_{mm \text{ estimated}} @ N_{max} = \%G_{mm \text{ trial}} @ N_{max} - (4.0 - V_a) \quad (3.21)$$

Superpave stipulated that the %G<sub>mm</sub> at N<sub>max</sub> shall always be less than 98.0 percent. For KDOT projects, %G<sub>mm</sub> at N<sub>max</sub> shall be at most 98.5%.

Finally, there is the requirement for the **dust proportion (DP)**, sometimes called the dust-to-binder *ratio*. It is calculated by dividing the percent (by mass) of the material passing the 0.075 mm sieve (from wet sieve analysis) by the effective asphalt binder content (expressed as *percent by mass of mix*). The effective asphalt binder content is calculated using:

$$P_{be} = P_{b,estimated} - \left[ (P_s \times G_b) \times \left( \frac{G_{se} - G_{sb}}{G_{se} \times G_{sb}} \right) \right] \quad (3.21)$$

where:

- P<sub>be</sub> = effective asphalt content, percent (by total mass of mixture)
- P<sub>s</sub> = aggregate content, percent (by total mass of mixture)
- G<sub>b</sub> = specific gravity of asphalt
- G<sub>se</sub> = effective specific gravity of aggregate (*determined from Eq. 2.2*)
- G<sub>sb</sub> = bulk specific gravity of aggregate
- P<sub>b,estimated</sub> = asphalt content, percent (by total mass of mixture) (*estimated from Eq. 3.17*)

The **dust proportion (DP)** is calculated as:

$$DP = \left[ \frac{P_{.075}}{P_{be}} \right] \quad (3.22)$$

where:  $P_{0.075}$  = aggregate content passing the 75  $\mu\text{m}$  sieve, percent by mass of aggregate  
 $P_{be}$  = effective asphalt content, percent by the total mass of the mixture

According to Superpave, an acceptable dust proportion ranges from **0.6 to 1.2**, **0.8 to 1.6**, or **0.9 to 2.0**, depending upon mixture type and/or size. *KDOT requirements are the same (see Table 602-1 in the Special Provision to Section 602 of the 2015 KDOT Standard Specifications (latest revision)).*

After establishing all the estimated mixture properties, the designer can review the trial blends and decide if one or more are acceptable or if further trial blends need to be evaluated.

### KDOT Requirements for Volumetric Properties

*KDOT has established the requirements for Superpave volumetric mixtures in Kansas, as shown in Table 3.5. KDOT intends that all mixtures be designed and produced at **3.0 percent air voids**. The percent VFA and the Superpave Gyratory Compactor gyration levels ( $N_{ini}$ ,  $N_{des}$  &  $N_{max}$ ) will be listed in the project's Special Provisions. The minimum VMA values shown for the mixture in Table 3.5 shall be the minimum permitted throughout the range of binder percentages used in the mix design.*

### Design Asphalt Binder Content

Once the design aggregate structure and an estimated binder content have been selected from the trial blends, more specimens are compacted by varying the estimated asphalt binder content. The mixture properties are then evaluated to determine a design asphalt binder content.

A minimum of two specimens are compacted at the trial blend's *estimated asphalt content*, *at  $\pm 0.5\%$  of the estimated asphalt content and at  $+ 1.0\%$* . The four asphalt contents are the minimum required for the Superpave volumetric mixture design.

A minimum of two specimens are also prepared to determine the maximum theoretical specific gravity at the estimated binder content. Specimens are prepared and tested like the specimens in this chapter's "Selection of Design Aggregate Structure" section.

**Table 3.5 KDOT Superpave Volumetric Mixture Design Requirements\***

Mixture Type	Dust Proportion	Air voids at $N_{des}$	Minimum VMA (%)	Minimum Tensile Strength Ratio
SM-4.75A, SR-4.75A	0.9 – 2.0	3.0	16.0	80
SM-9.5A, SR-9.5A SM-9.5B, SR-9.5B	0.6 - 1.2 0.8 - 1.6	3.0	15.0	80
SM-9.5T, SR-9.5T	0.8 - 1.6	3.0	15.0	80
SM-12.5A, SR-12.5A	0.6 - 1.2	3.0	14.0	80
SM-12.5B, SR-12.5B	0.8 - 1.6	3.0	14.0	80
SM-19A, SR-19A SM-19B, SR-19B	0.6 - 1.2 0.8 - 1.6	3.0	13.0	80

\* Confirm table values using Table 602-1 in Section 602 of the 2015 KDOT Standard Specifications.

Mixture properties are evaluated for the selected blend at the different asphalt binder contents using densification data at  $N_{ini}$ ,  $N_{des}$ , and  $N_{max}$  levels. The volumetric properties are calculated at  $N_{des}$  for each asphalt content. From these data points, the designer generates the following graphs:

- air voids ( $V_a$ , %) versus asphalt content (%)
- VMA (%) versus asphalt content (%)
- VFA (%) versus asphalt content (%)

**The design of the asphalt binder content is established at 3.0 percent air voids.** All other mixture properties (% $G_{mm}$  at  $N_{ini}$ , %  $G_{mm}$  at  $N_{max}$ , and dust proportion) are checked at the design asphalt binder content to verify that they meet the established criteria.

## Moisture Susceptibility

The final step in the Superpave volumetric mix design process is to evaluate the moisture susceptibility of the design mixture. This step is accomplished by performing the KT-56 test on the design aggregate blend at the design asphalt binder content. Specimens are compacted to **7 ± 0.5 percent** air voids. Loose lab-produced mixtures are aged for 2 hours at compaction temperature before compaction. One subset of three specimens is considered control specimens. The other subset of the three specimens is conditioned. The conditioned specimens are subjected to partial vacuum saturation (70% to 80% of air voids) followed by a freeze cycle at **-18°C for a minimum of 16 hours**. The final conditioning step is a hot water soak at **60°C for 23 to 25 hours**. All specimens are then placed in a **25°C** water bath for **2 hours**. The specimens are then removed from the water bath and tested at a **51 mm/minute** loading rate. The peak loads are recorded. The tensile strength is computed using the following formula:

$$S_t = \frac{2000 \times P}{\pi \times t \times D} \quad (3.23)$$

where:

- $S_t$  = tensile strength (kPa)
- $P$  = maximum load (N)
- $t$  = specimen thickness (mm)
- $D$  = specimen diameter (mm)
- $\pi$  = pi (constant value of 3.14)

Table 3.6 outlines the current test parameters in KT-56. Note that testing requirements may vary when a lime anti-stripping agent is used in the mixture, as outlined in KT-56. The moisture susceptibility is determined as a ratio of the average tensile strengths of the conditioned subset to the average tensile strengths of the unconditioned subset and is calculated as:

$$TSR = \frac{S_2}{S_1} \quad (3.24)$$

where:

- TSR = tensile strength ratio
- $S_1$  = average tensile strength of unconditioned subset, and
- $S_2$  = average tensile strength of conditioned subset.

When an anti-stripping agent is used, please include it in all asphalt mixtures for the conditioned and unconditioned subsets. *The Superpave criterion for the acceptable minimum tensile strength ratio is 80 percent, and KDOT adopts this minimum.*

**Table 3.6 Test Parameters for Moisture-Susceptibility Test (KT-56)**

Test Parameter	Test Requirement
Loose mix Aging (lab-prepared mix only)	2 hrs $\pm$ 5 min at compaction temperature
Theoretical Maximum Specific Gravity	KT-39
Air Voids of Compacted Specimens	7 $\pm$ 0.5 (6.5 to 7.5%)
Before or after Compaction Aging <sup>1</sup>	24 $\pm$ 1 Hours
Sample Grouping	The average air voids of the two subsets should be approximately equal.
Vacuum Saturation	70 to 80% of air voids
Swell Determination	None (however, record data per 7.3.8)
Freeze	Minimum 16 hrs at -18 $\pm$ 5°C
Hot Water Soak	24 $\pm$ 1 hrs at 60 $\pm$ 1°C
Recondition for Test Temperature	2 hrs $\pm$ 10 minutes at 25 $\pm$ 0.5°C
Strength Property	Indirect tensile strength
Loading Rate	51 mm/min at 25 $\pm$ 0.5°C
Precision Statement	None
Test Parameter	The ratio of the average indirect tensile strength of wet/conditioned specimens to that of dry/unconditioned specimens
<sup>1</sup> The aging protocol of AASHTO T283 does not match the aging protocol of Superpave or KT-56.	

## CHAPTER IV

### OVERVIEW OF SUPERPAVE VOLUMETRIC MIX DESIGN

#### Design Steps

There are four significant steps in the testing and analysis process for the Superpave volumetric mix design:

- 1.) Selection of materials (aggregates, binders, modifiers, etc.)
- 2.) Selection of a design aggregate structure
- 3.) Selection of a design asphalt binder content
- 4.) Evaluation of moisture susceptibility of the design mixture

The first step in selecting materials consists of determining the traffic and environmental factors for the paving project. From there, the performance grade (PG) of the asphalt binder required for the project is selected. Aggregate requirements are determined based on traffic. Materials are chosen based on their ability to meet or exceed the established criteria.

The selection of the design aggregate structure consists of determining the aggregate stockpile proportions and corresponding combined gradation of the mix design. The design aggregate structure should yield acceptable volumetric and compaction properties compared to the mixture criteria (*based on traffic and environmental conditions*) at the design asphalt binder content.

The selection of a design asphalt binder content consists of varying the amount of asphalt binder in the design aggregate structure to obtain acceptable volumetric and compaction properties when compared to the mixture criteria (based on traffic and environmental conditions). It is a verification of the results obtained from the previous step. This step also allows the determination of the changes in the volumetric and compaction properties with changes in the asphalt binder percentage.

Evaluation of moisture susceptibility consists of testing the mixture at design asphalt content by KT-56 to determine if the mix will be susceptible to moisture damage.

A complete outline of the steps in the **Superpave Volumetric Mix Design** is shown below:

#### I. SELECTION OF MATERIALS

##### A. Selection of Asphalt Binder

1. Determine project weather conditions using weather database
2. Select reliability

3. Determine design temperatures
4. Verify asphalt binder grade
5. Establish temperature-viscosity relationship for lab mixing and compaction

B. Selection of Aggregates

1. Consensus properties:
  - a. Combined gradation
  - b. Coarse aggregate angularity
  - c. Fine aggregate angularity
  - d. Flat and elongated particles
  - e. Clay content
2. Agency and Other properties:
  - a. Specific gravity
  - b. Toughness
  - c. Soundness
  - d. Deleterious materials
  - e. Other

C. Selection of Modifiers (if any)

II. SELECTION OF DESIGN AGGREGATE STRUCTURE

A. Establish Trial Blends

1. Develop three blends
2. Evaluate combined aggregate properties

B. Compact Trial Blend Specimens

1. Establish trial asphalt binder content
2. Establish trial blend specimen size
3. Determine  $N_{ini}$ ,  $N_{des}$  and  $N_{max}$
4. Batch trial blend specimens
5. Compact specimens and generate densification tables
6. Determine mixture densities ( $G_{mm}$  and  $G_{mb}$ )

C. Evaluate Trial Blends

1. Determine  $\%G_{mm}$  at  $N_{ini}$ ,  $N_{des}$  and  $N_{max}$
2. Determine  $\%$  Air Voids and  $\%$  VMA

3. Estimate asphalt binder content to achieve 4% air voids (3% for *KDOT*)
  4. Estimate mix properties at estimated asphalt binder content
  5. Determine dust proportion
  6. Compare mixture properties to criteria
- D. Select Most Promising Design Aggregate Structure for Further Analysis

### III. SELECTION OF DESIGN ASPHALT BINDER CONTENT

- A. Compact Design Aggregate Structure Specimens at Multiple Binder Contents
1. Batch design aggregate structure specimens
  2. Compact specimens and generate densification tables
- B. Determine Mixture Properties versus Asphalt Binder Content
1. Determine %G<sub>mm</sub> at N<sub>ini</sub>, N<sub>des</sub> and N<sub>max</sub>
  2. Determine % Air Voids and % VMA
  3. Determine dust proportion
  4. Graph mixture properties versus asphalt binder content
- C. Select Design Asphalt Binder Content
1. Determine asphalt binder content at 4% air voids (3% for *KDOT*)
  2. Determine mixture properties at selected asphalt binder content
  3. Compare mixture properties to criteria

### IV. EVALUATION OF MOISTURE SUSCEPTIBILITY OF DESIGN ASPHALT MIXTURE

- A. Test Design Asphalt Mixture as per KT-56

**COMPACTION OF SUPERPAVE HMA SAMPLES  
USING THE PINE SUPERPAVE GYRATORY  
COMPACTOR**

## SUPERPAVE HOT MIX ASPHALT GYRATORY COMPACTION

**1.0 Objective:** To compact hot mix asphalt (HMA) specimens for Superpave volumetric mixture design, analysis, or moisture susceptibility determination.

### 2.0 Equipment:

**2.1 Main:** A Superpave gyratory compactor with a printer.

#### 2.2 Ancillary:

- (i) thermostatically-controlled ovens for heating aggregates, asphalt, and equipment.
- (ii) Large mechanical mixer, bowls, 5-liter capacity.
- (iii) Flat- bottom metal pans for heating aggregates.
- (iv) Round metal pans, approximately 10 liters (10-qt.) capacity, for mixing asphalt and aggregate.
- (v) Scoop for batching aggregates.
- (vi) Containers: gill-type tins, beakers, or pouring pots for heating asphalt.
- (vii) Thermometers: armored, glass, or dial-type with metal stem, 10°C to 235°C, for determining the temperature of aggregates, asphalt, and asphalt mixtures.
- (viii) Balances: 10-kg capacity, sensitive to 1 g, for weighing aggregates and asphalt; 10-kg capacity, sensitive to 0.1 g, for weighing compacted specimens.
- (ix) Large mixing spoon or small trowel.
- (x) Large spatula.
- (xi) Welders gloves for handling hot equipment.
- (xii) Paint, markers, or crayons to identify test specimens.
- (xiii) Paper disks (100 mm or 150 mm) for compaction.
- (xiv) Fans are used to cool compacted specimens.

### 3.0 Sample size

One compacted specimen (150 mm diameter x nominal 115 mm height) needs an aggregate mass of approximately 4,500 g.

The loose mixture sample used to determine the maximum theoretical specific gravity (G<sub>mm</sub>) needs an aggregate mass of approximately 2,000 g.

Moisture Susceptibility testing using KT-56 requires a nominal specimen height of 95 mm and approximately 3,700 g of aggregate.

### 4.0 Approximate Working Temperature

Mixing temperature: Temperature corresponding to binder viscosity of  $0.17 \pm 0.02$  Pa·s (or, approx.  $143.5 \pm 5.6^\circ\text{C}$ )

Aggregate temperature: Mixing temperature + 15° C (or, approx.  $158.5 \pm 5.6^\circ\text{C}$ )

Asphalt temperature: Mixing temperature + 15° C (or, approx.  $158.5 \pm 5.6^\circ\text{C}$ )

Compaction temperature: Temperature corresponding to binder viscosity of  $0.28 \pm 0.03$  Pa·s (or, approx.  $132.5 \pm 5.6^\circ\text{C}$ )

**Short-term aging temperature:** **Compaction Temperature for 2 hours +/- 5 minutes.**  
**(Loose Mixture, lab mix only)**

## 5.0 Operation of the Gyratory Compactor:

The Superpave gyratory compactor is a Pine Instrument Company Gyratory Compactor model AFGC125X or equivalent.

### 5.1 Control:

Always use automated control. *Please do not attempt to gyrate a mold without a mixture in it or without applying consolidation pressure. Also, do not manually rotate the carriage with a mold unless a consolidation pressure is applied to a specimen in the mold.*

Figure 5.1 shows the control screen of the Pine gyratory compactor model AFGC125X.

### 5.2 Setting:

The gyratory compactor control system allows for changing the compaction parameters. Use the **SELECT** key to choose the parameter to be changed (the selected value will flash). Use the **ARROW** keys to change the value to the desired setting. Only valid values will be accepted. Press the **ENTER** key to store the new value. The **SELECT** key will also store the new value and move to the following parameter. The **OTHER OPTIONS** on screen #2 will activate additional parameters that may be changed. The settings are saved in non-volatile memory, requiring resetting when a change is needed. Usually, no resetting is necessary during a particular mixture design process. We will use the following mode for our class:

**COMPACTION MODE: Compact to Number of Gyration**

Figure 5.1 Controls for a Pine Gyratory Compactor

In the **Compact to Number of Gyration** mode of operation, the gyratory compactor applies the set consolidation pressure, gyrates the specimen to the preset number of gyrations, and then parks

automatically. The required settings are shown in Figure 5.2.

**OTHER SETTINGS:** No change will be required.

**Caution:** Do not press the ROTATE, RAM, and ANGLE keys for compaction.

#### SCREEN #1

"SPECIMEN DIA: 150mm"	Specimen size: 100 mm or 150 mm
"PRESSURE: 600 kPa"	Compaction pressure. Valid range: 200-1000 kPa
"SET GYRATIONS: 150 "	Total number of gyrations. Valid range : 0-999
"SPEC. HT.: -----mm "	Data output.

#### SCREEN #2

"SQ.PRESSURE: 600 kPa"	Pressure used to square specimen after gyration. Valid range: 200-1000 kPa
"SQ. DELAY: 0 Sec"	Time at square pressure. Valid range: 0-99 seconds.
"OTHER OPTIONS "	Access additional machine parameters.
"MACHINE HOURS: xxx.x"	Total machine hours. Only actual run time is accumulated.

**Figure 5.2 Required Superpave gyratory compactor settings.**

### 5.3 Mold Preparation

A clean mold assembly is essential for gyratory compaction. Follow the steps below in mold preparation for gyratory compaction:

- (1) Clean and preheat the mold, base plate, and top plate. This is done at the mix's high side of the compaction temperature range.
- (2) Place the preheated mold in the compactor extruder bracket. Lightly lubricate the bottom surface of the mold base plate with dry lubricant. Use the extruder to lift its ram and support the mold base plate. Place a paper disk into the mold on top of the mold base plate. Note that the correct orientation of the mold base flange is up (see Figure 5.3).
- (3) Release the extruder's pressure so that the mold base plate is at the bottom of the mold.
- (4) Lubricate the top surface of the mold top plate and the compaction chamber base with a dry lubricant. The top plate should have a medium coating of lubricant over the entire area except near the center, where a heavy coat is required. The compaction chamber lubrication should be light and may not be needed after one test.
- (5) Place the loose, preheated mixture into the mold. Use the extruder to lift the loose specimen so that its top is near flush with the top of the mold. Using a trowel, ensure the mixture's top is somewhat level. Place a paper disk, then the mold top plate, on top of the mix. Note the correct orientation of the mold top plate is taper up (see Figure 5.3).

**Figure 5.3 Gyratory Compactor Mold Assembly**

- (6) Release the extruder pump valve. Be sure there is no foreign debris on the mold flange. Wipe the mold flange on all surfaces with an oily rag. This lubrication will help prevent the rollers from skipping and grooving the flange. The mold is now ready to be placed into the compaction chamber.

#### 5.4 Compaction Procedure

Follow the steps below to initiate the compaction procedure after preparing the mold as per section 5.3.

- (1) Place the mold into the chamber and check that the mold is correctly seated in the carriage by rotating it counterclockwise. The mold will spin easily when adequately sitting on all three sets of carriage rollers, and they will fully engage the mold flange. ***Ensure the anti-rotation cog rests at the back of the chamber (12 o'clock).***
- (2) Once the input parameters on the control panel have been set and the mold is correctly seated in the compaction chamber, close the chamber door. ***The machine-ready light should now be illuminated.*** If it is not lit at this point, the machine is not properly parked and will not initiate a test sequence.
- (3) Ensure the printer is on and connected to the gyratory compactor.
- (4) Ensure all input parameters are correct before starting a test. Press the **ENTER** and **START** keys simultaneously to have the machine self-park (first test sequence only). Press **START** to initiate the compaction. Press **START** to initiate the compaction any other time after the test parameters have been used in a prior test sequence. The printer will print the gyration number and specimen height in real-time.
- (5) The machine will automatically stop and park when the test has been completed. ***After the machine-ready light is lit, remove the mold from the compaction chamber and allow it to cool down sufficiently before extruding the specimen from the mold.***
- (6) Clean the compaction chamber to remove all debris.

Note: The **STOP** key may temporarily pause the compaction process. The test may then be restarted or aborted. The **EMERGENCY STOP** button will stop the test and remove ram pressure. Opening the compaction chamber door will also pause the test. If the test stops, the **START** key must be pressed to restart the machine. The test printout will indicate that the compaction process was paused before completion.

#### 5.5 Maintenance

For routine maintenance, see Section 4.3 of the Pine AFGC125X Gyrator Compactor Operation Manual.

#### 5.6 Calibration

Check the calibration as per recommendation in the Pine AFGC125X Gyrator Compactor Operation Manual.

## **5.7 Applicable Standards**

KT-58	Method for Preparing and Determining the Density of Hot Mix Asphalt (HMA) Specimens by Means of the Superpave Gyratory Compactor
KT-15	Bulk Specific Gravity and Unit Weight of Compacted Bituminous Mixtures
KT-39	Theoretical Maximum Specific Gravity of Bituminous Paving Mixtures
KT-56	Resistance of Compacted Asphalt Mixture to Moisture Induced Damage

# A SIMPLE OPERATIONAL MANUAL FOR THE ASPHALT BINDER IGNITION OVEN (GILSON HM-378) STEP-BY-STEP PROCEDURE

## A. INITIAL PHASE

1. Preheat the ignition furnace to 500°C (932°F) using the control panel as follows:
  - a) If the desired **program** is **known**,
    - 1) Press **<enter>** to bring the furnace to "idle."  
Press **<enter>** to display "\_\_\_\_\_".
    - 2) Press **<program>** and <number of desired program>.
    - 3) After the desired program has been selected and the furnace is "idle," press **<enter> <enter>**. The furnace will switch to preheat.
  - b) If the desired **program** is **unknown**,
    - 1) The furnace comes with one preset program. To review the program from "idle", press **<enter>** and **<program review>**. Customized Programs can be reviewed (starting from idle) by pressing <program> and the desired number, pressing <enter> then <stop>. Next, press <enter> then <program review>.
    - 2) After the desired program has been selected and the furnace is "idle" press **<enter> <enter>**. The furnace will switch to preheat.
  - c) **Customizing Programs:\*\***
    - 1) From "idle" press **<enter>** to display "\_\_\_\_\_".  
Press **<program>** and a number where the new parameters will be stored.  
Pressing the **<enter>** key causes the program to step through preset parameters. Continue pressing **<enter>** until the parameter to be changed is displayed. Enter the new parameter and press **<enter>**. Continue scrolling through the program until "idle" is displayed.
    - 2) After the desired program has been selected and the furnace is "idle" press **<enter> <enter>**. The furnace will switch to preheat.
2. Record the mass of the enclosure device (sample basket and catch pan) and any guards supplied by the manufacturer.
3. Prepare the sample as Section 5 of Kansas Test Method KT-57 describes. Place the sample in the sample enclosure device. Evenly distribute the loose mixture in the basket, keeping the material away from the edges of the basket. Use a spatula or trowel to level the specimen.
4. Record the mass of the sample and the sample enclosure device.

**\*\*Note:** The Bituminous Research Section's preliminary study has shown that a temperature of **500°C** and a holding time of 40 minutes are insufficient to burn most samples weighing around 1,500 g.

## **B. IGNITION PHASE**

1. Confirm the oven has been preheated.
2. Open the chamber door and place the loose mixture and sample enclosure device in the furnace. Close the chamber door.
3. After the sample has been loaded and the door closed:
  - a) Press **<continue>** on the control panel to begin the ignition phase of the test

Note: **DO NOT OPEN THE FURNACE DOOR** after starting this test sequence. The asphalt vapors are flammable at 500C (932F) and may ignite if the door opens.

*Figure 1 below shows the ignition sequence.*

## **C. END OF IGNITION PHASE**

- 1) When the alarm begins beeping, the hold cycle is complete.
  - a.) Press **<stop>**, the furnace will return to preheat mode.
  - b.) If this is the last sample, go to **C.2** and then shut down per **E.1**.

Note: This procedure is set up for the beginner. With experience, the sequencing of samples and a more efficient use of time will become apparent.

- 2) Remove the burnt material and allow it to cool enough to handle.
- 3) After the burnt material has cooled, weigh and record the mass of the sample and the sample enclosure device, and record the weight as the **"After Wt."**
- 4) Repeat the steps above until a visual inspection indicates complete burn-off has been accomplished (KT-57, 10.10)

## **D. WASH GRADATION**

- 1) Allow the material to cool to room temperature.
- 2) run a washed gradation (KT-34) after the material has cooled.
- 3) Calculations:
  - a.) **0% asphalt;** "% retained" is calculated using the "Before Wt. (B<sub>1</sub>)" data.  
$$\% \text{ Ret.} = [(g \text{ Ret.})/B_1] 100$$
  - b.) **For all other asphalt contents,** "% Retained" is calculated using the "After Wt. Corrected (W<sub>A</sub>)" data.  
$$\% \text{ Ret.} = [(g \text{ Ret.})/W_A] 100$$

**Figure 1 Ignition Sequence (after Gilson Co., Inc.)**

Example:

Pre-Heat Temperature set to 500°C  
 Burn-Out Temperature set to 500°C  
 Hold Time (Decoking) set at 40 minutes

1. Room Temperature
2. Pre-Heat temperature programmed by the user
3. Open the door to load the sample; heat escapes
4. Close the door and start the test
5. Burn-out temperature programmed by the user (Could be the same as 2)
6. Peak Temperature as asphalt ignites and burns off (Varies)
7. Temperature returns to programmed burn-out setting. Hold time (decoking) starts
8. End of Hold Time. The door can be opened, the sample is removed, and heat escapes
9. The door is closed
10. Furnace returns to programmed pre-heat temperature

#### E. SHUTTING DOWN

- 1) After the last sample has been finished, open the furnace door and push **<stop>** once to bring it to the preheat mode. Press **<stop>** again to begin cooling down the furnace. The temperature on the control panel will blink, indicating that the furnace is cooling. Once the temperature is below 300°C, the power can be shut off.

#### F. SPECIAL NOTES

- 1) **On occasion, Samples containing asphalt content greater than 6.0% required an additional 10-minute holding time.** Therefore, two programs were developed to meet these needs. The primary program contained a 40-minute hold cycle and was used on all samples. The secondary program contained a 10-minute holding time and was used if the sample showed signs of incomplete burning.
- 2) Preliminary studies have also shown that the condition of the filter in the binder ignition furnace influences the burning process and, hence, the test results. Depending on the asphalt content of the samples, the filter may need to be replaced as often as every 2 - 4 tests.
- 3) Because of the different intrinsic qualities of aggregate, there is a potential for aggregate breakdown during the ignition process. Sometimes, a correction factor must be calculated (during the mix design phase) to correct for the aggregate loss. Evaluate the aggregate breakdown by comparing the gradation analysis from the residual aggregates after the burn-off to the gradation of an unburned, "blank" specimen **(Refer to KT-57, 6.6)**

#### G. SPECIAL CAUTIONS

- 1) Check that a filter is installed correctly in the slot at the top of the furnace and that it has not clogged from previous tests to hinder airflow. Check the filter before each test.
- 2) Be sure that the afterburner fan has been properly programmed at a fan-on temperature setting of the afterburner.
- 3) Do not look through the small hole in the front of the chamber without wearing any eye protection.
- 4) Never leave the furnace unattended near the end of burning.

# Laboratory Study Manual

# KDOT Standard Test Methods

## 5.9.01 SAMPLING AND SPLITTING OF AGGREGATES (Kansas Test Method KT-01)

### **1. SCOPE**

These methods apply to the sampling of coarse and fine aggregates for quality tests and for inspection and testing of aggregates being produced for State construction and maintenance work. **KT-01** reflects testing procedures found in **AASHTO R 90** and **R 76**.

Where practicable, samples to be tested for quality shall be obtained from the finished product. Conditions may require sampling from hauling units or from stockpiles located at the production plant site or a specified location.

General policy regulations covering the frequency of and procedures for sampling aggregates are set forth in **Part V, Section 5.6** of this manual.

### **2. REFERENCED DOCUMENTS**

**2.1.** KDOT Construction Manual, Part V, Section 5.6; Aggregates

**2.2.** AASHTO R 90; Sampling Aggregate Products

**2.3.** AASHTO R 76; Reducing Samples of Aggregate to Testing Size

### **3. SAMPLING METHODS**

#### **3.1. Sampling from Discharge or Flowing Streams:**

Obtain at least three approximately equal sample increments, selected at random from the stream and combine to form a field sample that equals or exceeds the minimum required mass. Take each increment from the entire cross section of the material as it is being discharged. It is usually necessary to have a special device constructed for a particular plant. This device consists of a pan of sufficient size to intercept the entire cross section of the discharge stream and hold the required quantity of material without overflowing. A set of rails may be necessary to support the pan as it is passed under the discharge stream. The use of heavy equipment, such as a loader, may also be enlisted for this purpose. Sampling the initial discharge or the final few tons from a bin or conveyor belt increases the chance of obtaining segregated material and should be avoided. To the extent possible, keep bins continuously full to reduce segregation.

#### **3.2 Sampling from a Stationary Conveyor Belt:**

Only when the belt is completely stopped and easily within reach, should belt samples be obtained. Never walk on a stopped conveyor belt. Elevated conveyors must be equipped with a suitable walkway and necessary fall protection must be utilized. An individual obtaining a conveyor belt sample must have their own lock out/tag out device(s) in place during sampling.

Insert two templates, the shape of which conform to the shape of the belt, in the aggregate stream on the belt. Carefully scoop all material between the templates into a suitable container and collect the fines from the belt with a brush and dustpan and add to the container. Obtain at least three approximately equal increments, selected at random, and combine to form a field sample with a mass that equals or exceeds the minimum.

### 3.3. Sampling from Stockpiles:

When possible, avoid sampling from stockpiles. It is very difficult to ensure unbiased samples due to the segregation which often occurs when material is stockpiled with coarse particles rolling to the outside base of the pile.

Loaders must be used to scoop material from the main stockpile and create a separate smaller stockpile. This should be done by loading out a minimum of three buckets from various heights and locations around the main pile and dumping each load on top of the previous in a separate location. When feasible, stockpiles under production can be sampled by moving the stacking or conveyor equipment in order to create the smaller pile for sampling.

For coarse aggregate, the loader should flatten one side of the pile by inserting the bucket vertically at or near the apex of the pile, and backing the material out away from the pile. The flattened material should then be sampled by inserting a shovel vertically in at least 5 different locations. Combine the individual increments to produce a field sample weighing not less than 75 lb (35 kg), mix thoroughly and reduce to the specified size for testing.

For fine aggregate, collect the sample using a sampling tube or shovel. Sample fine aggregate with a sampling tube having a diameter at least three times the size of the maximum size aggregate being sampled. Scalp away the outer layer of fine aggregate to assure the sample has not become segregated. Obtain a minimum of five increments at several locations in the pile with samples taken from each 1/3 volume of the pile by inserting the tube or digging a hole 1 to 2 ft (0.3 to 0.6 m) deep. Combine the individual increments to form a field sample, mix and reduce to proper size for testing.

**3.4. Plant Mixed Aggregate:** There are several acceptable methods of taking samples from each type of plant. Every situation should be studied and evaluated to determine whether or not the method to be used will provide a representative sample of the material being produced. Plant mixed aggregate samples are generally obtained by one of the following procedures. If these procedures, due to unforeseen circumstances, prove to be unworkable, other procedures may be used if approved in writing by the District Materials Engineer.

#### 3.4.1. Apparatus.

##### 3.4.1.1. For Asphalt Plant Sampling.

**3.4.1.1.1. For Batch Plants:** A vertical receptacle having a closed bottom and an open top with no dimension in the opening of less than 5 in (125 mm). Appropriate handles for lifting and handling and a wide flat base for vertical stability are recommended. The height of the container must be sufficient that it will not overflow during the discharge of material from the pugmill.

Some containers have been designed to automatically split the material that enters the opening into two or more portions and discard one-half or more of all material received.

**3.4.1.1.2. Continuous Flow Plants:** A horizontal trough having a minimum width of 5 in (125 mm), a minimum depth of 12 in (300 mm), and a length equal to or greater than the width of the pugmill discharge stream., so constructed that it can be passed through the pugmill stream in a horizontal plane. Appropriate handles for lifting and handling are required. The apparatus shall meet the requirements in **Section 3.1.**, of this test method and be approved by the District Materials Engineer.

**3.4.1.2.** For Screenless Operation Sampling: The apparatus shall meet the requirements in **Section 3.1.** of this test method and be approved by the District Materials Engineer.

**3.4.2.** Procedure.

**3.4.2.1.** For Asphalt Plant Sampling.

**3.4.2.1.1.** Batch Plant: Center the container under the pugmill discharge, open the gate and empty the pugmill before removing the container.

**3.4.2.1.2.** Continuous Flow Plants: Pass the container horizontally through the drum discharge stream in such a manner that a representative sample will be obtained, and the container will not be filled to overflowing.

**3.4.2.2.** For Screenless Operation Sampling: The contractor shall provide a system for sampling the combined material ahead of the mixing chamber. Such a system must be approved by the District Materials Engineer.

**3.5.** Windrows: Windrows are not to be sampled until all blending and mixing is completed. They must be sampled by methods that will ensure that the sample will be representative of the material within the windrow cross section at the point of sampling. Power equipment is helpful in cutting through a windrow prior to sampling and should be used whenever available. Samples should be ample size to be representative of the windrow at the point of sampling and reduced to proper size for testing.

It has been determined that windrows containing aggregate with not more than 10% of material retained on the 3/8 in (9.5 mm) sieve and not more than 25% crushed material may be effectively sampled with a standard sampling tube.

To provide an acceptable sample, the following conditions are required:

**3.5.1.** A properly mixed and well “peaked” windrow.

**3.5.2.** Force the tube into the windrow and equal number of times, well-spaced, on each side of the windrow, and in a direction normal to the slope of the windrow face.

**3.5.3.** Sample size is sufficient for reduction by splitting using the standard procedure. Not less than 75 lb (35 kg) sample is recommended.

**3.6.** Unopened Sand-gravel Deposits: Unopened deposits of sand-gravel are usually explored by drilling test holes spaced at regular intervals over the area underlaid by the deposit. The holes are extended through the soil and other non-usable over-burden and through the workable depth of the deposit. Remove the sand-gravel from each test hole and examine for major changes in the quality and gradation characteristics, then record such changes. Place all usable material removed from each test hole on a quartering canvas, sheet of plywood, or other material to prevent contamination from grass, topsoil, etc. Thoroughly mix a 15 lb (7 kg) sample for gradation tests.

If the quality of the material removed from all test holes appears to be reasonably uniform, a sufficient amount of material from each test hole should be obtained to produce a 200 lb (90 kg) composite sample for quality testing. This sample will be tested for information only.

## 4. SAMPLE REDUCTION

**4.1. Quartering Canvas Procedure:** Samples that weigh 75 lb (35 kg) or more may be reduced to one-half size by using a quartering canvas. The canvas is not to be used as the first step in the reduction of samples smaller than approximately 75 lb (35 kg).

**4.1.1.** Spread the canvas on a smooth level surface. Dump the sample in a pile near the center and mix by alternately lifting each corner and rolling the aggregate toward the opposite corner. This should be performed in a vigorous manner.

**4.1.2.** Center the material on the canvas in a uniform pile. Flatten the pile to a uniform thickness and diameter by pressing down the apex with a straight-edge scoop, shovel, or trowel (depending on the size of sample). Press down so that each quarter sector of the resulting pile will contain the material originally in it. The diameter should be approximately four to eight times the thickness.

**4.1.3.** Insert a rod, shovel handle, or similar object under the canvas and under the center of the pile and lift both ends of the rod to divide the pile into two equal parts. Remove the stick leaving a fold of the blanket between the divided portions. Insert the rod under the canvas and under the center of the resulting two piles at right angles to the first division and again lift the rod to divide the sample into four equal parts.

**4.1.4.** Discard two opposite quarters, combine the two remaining quarters, mix and reduce to proper size with a riffle splitter or by repeating the quartering procedure.

When a quartering canvas is used, the Field Engineer and District Materials Engineer should be certain that proper procedures are being followed at all times.

**4.2. Riffle Splitter:** The initial sample size shall be at least four times the size of the required test portion. If use of this method is desired and the sample has free moisture on the particle surfaces, the entire sample must be dried to at least the saturated-surface-dry condition (SSD) using temperatures that do not exceed those specified for any tests contemplated. If the moist sample is very large, a preliminary split may be made using a mechanical splitter having wide chute openings 1 1/2 in (37.5 mm) or more to reduce the sample to not less than 5000 g.

**4.2.1. Apparatus:** The splitter shall have an even number of equal width chutes, not less than a total of eight for coarse aggregate, or twelve for fine-aggregate, which discharge alternatively to each side of the splitter. For coarse and mixed aggregate the minimum width of the individual chutes shall be approximately 50% larger than the largest particles in the sample to be split. For dry fine aggregate, finer than the 3/8 inch (9.5 mm) sieve, a splitter having chutes 1/2 to 3/4 inches (12.5 to 19 mm) wide shall be used. The splitter shall be equipped with two receptacles to hold the two halves of the sample following splitting. A hopper or straight-edged pan, with a width equal to or slightly less than the overall width of the assembly of chutes, shall be used to feed the sample at a controlled rate to the chutes. The splitter and accessory equipment shall be designed so the sample will flow smoothly without restriction or loss of material.

**NOTE:** Any disputed samples shall be split using the appropriate splitter meeting the above specifications.

**4.2.2.** Place the original sample in the hopper or pan and uniformly distribute it from edge to edge, so that when it is introduced into the chutes, approximately equal amounts will flow through each chute. The rate at which the sample is introduced shall allow free flowing through the chutes into the receptacles

below. Reintroduce the portion of the sample in one of the receptacles into the splitter as many times as necessary to reduce the sample to the size specified for the intended test.

**4.3. Miniature Stockpile Sample Reduction Procedure:** This method of sample reduction may be used only on wet fine aggregate. For this quartering procedure, wet is defined as free moisture on the surface as approximated by the fine aggregate retaining its shape when molded by hand.

Place the sample on a clean, hard, level surface where there will be neither loss of material nor the accidental addition of foreign material. The initial sample size shall be at least four times the size of the required test portion. Mix the sample thoroughly with a shovel by turning it over completely three times. With the last turning, shovel the entire sample into a conical pile by depositing each shovelful on top of the preceding one. Carefully flatten the conical pile to a uniform thickness and diameter by pressing down on the apex with a shovel so that each quarter sector of the resulting pile will contain the material originally in it. The diameter should be approximately four to eight times the thickness. Divide the flattened pile into four equal quarters with a straight edge (trowel or similar metal blade) and remove two pre-selected diagonally opposite quarters, using a brush or broom to clean the cleared space. Repeat the process until the sample is reduced to the proper size.

## 5.9.02 SIEVE ANALYSIS OF AGGREGATES (Kansas Test Method KT-02)

### **1. SCOPE**

This method of test covers procedures for the determination of the particle size distribution of aggregates using standard sieves. **KT-02** reflects testing procedures found in **AASHTO T 27**.

### **2. REFERENCED DOCUMENTS**

- 2.1.** Part V, 5.9; Sampling and Test Methods Foreword
- 2.2.** KT-01; Sampling and Splitting of Aggregates
- 2.3.** KT-03; Material Passing No. 200 (75µm) Sieve by the Wash Method
- 2.4.** ASTM E11; Woven Wire Test Sieve Cloth and Test Sieves
- 2.5.** AASHTO T 27; Sieve Analysis of Fine and Coarse Aggregates

### **3. APPARATUS**

**3.1.** The balance shall be readable to 0.1% of the sample mass and conform to the requirements of **Part V, Section 5.9; Sampling and Test Methods Foreword** of this manual for the class of general purpose balance required for the principal sample mass of the sample being tested.

**3.2.** Sieves meeting **ASTM E11**. As a minimum, set of sieves will include the 3/8 in (9.5 mm), No. 4 (4.75 mm), No. 8 (2.36 mm), No. 16 (1.18 mm), No. 30 (600 µm), No. 50 (300 µm), No. 100 (150 µm) and No. 200 (75 µm) for all aggregates. Gradations with larger sized aggregate will require addition of appropriate larger sieves to the set.

**3.3.** A mechanical sieve shaker shall impart a vertical, or lateral and vertical motion to the sieve, causing the particles to bounce and turn so as to present different orientations to the sieving surface. The sieving action shall be such that the criterion for adequacy of sieving is met in a timely manner as described in **Section 9**. of this test method.

**3.4.** An oven of appropriate size capable of maintaining a uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**3.5.** Drying pans.

### **4. SAMPLES**

**4.1.** Composition: Obtain samples for sieve analysis by the use of a sample splitter or by the method of quartering. Fine aggregate sampled by the quartering method shall be thoroughly mixed and in a moist condition. The sample for test shall be approximately the mass desired and shall be the end result of proper reduction methods. Do not attempt the selection of samples of an exact predetermined mass.

**4.2.** Fine Aggregates: Sample of fine aggregate for sieve analysis shall have a mass, after drying, not less than 300 g.

**4.3.** Coarse Aggregate: Samples of coarse aggregate and mixtures of coarse and fine aggregate for sieve analysis shall have a mass, after drying, not less than the amounts indicated in **Table 1**.

**Table 1**  
**Sample Size for Determination of**  
**Coarse Aggregate Gradation Tests**

Sieve Size	Minimum Mass of Samples (g)
2 1/2 in (63 mm) or more	35,000
2 in (50 mm)	20,000
1 1/2 in (37.5 mm)	15,000
1 in (25.0 mm)	10,000
3/4 in (19.0 mm)	5,000
1/2 in (12.5 mm)	2,000
3/8 in (9.5 mm) or less	1,000

**NOTE:** To select the sample size, use the largest sieve on which 5% or more of the material is specified to be retained.

**NOTE:** 12.00 in (300 mm) diameter sieves should be used for testing coarse aggregates and in testing samples with a mass of 5,000 g or more. If 12.00 in (300 mm) diameter sieves are not available, the split sample procedure in **Section 7.2** of this test method shall be used.

## **5. PREPARATION OF SAMPLES**

**NOTE:** Remove deleterious material prior to determining the total original dry mass of sample if required by relevant specifications.

**5.1.** Dry all samples to a constant mass at a temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ). Determine the mass of the sample to the nearest 0.1% of the sample mass. Record this as the total original dry mass of sample.

**5.1.1.** In the case of Cold in Place Recycle, air drying is acceptable.

**5.2.** Wash the sample over the No. 200 (75 $\mu\text{m}$ ) sieve as specified in **KT-03**. Then redry the sample to constant mass. Determine the mass of the sample to the nearest 0.1% of the total original dry mass of sample. Record this as the dry mass of sample after washing.

**NOTE:** For lightweight aggregate cover material: Dry-screen lightweight aggregate cover material according to **KT-04** instead of washing. Remove and discard all deleterious material from the sample including clay lumps retained on the No.4 (4.75 mm) sieve before the mass of the sample after dry-screening is determined.

**5.3.** For convenience, mixtures of coarse and fine aggregates may be separated into two portions by screening the dried sample over a No. 4 (4.75 mm) sieve.

**5.3.1** Reduce the material passing the No. 4 (4.75 mm) sieve by means of a sample splitter to a mass of approximately 1,000 g. Wash both the coarse and reduced fine portions of the total sample in accordance with **KT-03** and conduct a sieve analysis on each portion. Calculate the total combined grading in accordance with subsection **Section 7.2** of this test method.

## 6. TEST PROCEDURES

**6.1.** Nest the sieves in order of decreasing size of opening from top to bottom and place the sample, or portion of the sample, if it is to be sieved in more than one increment, on the top sieve. Agitate the sieves by mechanical sieve shaker for a sufficient period, established by trial or checked by measurement on the actual test sample, to meet the criterion for adequacy of sieving described in **Section 10.** of this test method.

**6.1.1.** If a mechanical sieve shaker is not used, follow the procedures for hand sieving in **Section 11.**

**6.2.** Limit the quantity of material on a given sieve so that all particles have opportunity to reach sieve openings a number of times during the sieving operation. For sieves with openings smaller than No. 4 (4.75 mm) the mass retained on any sieve at the completion of the sieving operation shall not exceed 4 g/in<sup>2</sup> (7 kg/m<sup>2</sup>) of sieving surface. For sieves with openings No. 4 (4.75 mm) and larger, the mass in kg/m<sup>2</sup> of sieving surface shall not exceed the product of 2.5 times the sieve opening in mm. In no case shall the mass be so great as to cause permanent deformation of the sieve cloth.

**NOTE:** The 4 g/in<sup>2</sup> (7 kg/m<sup>2</sup>) amounts to 200 g for the usual 8 in (203 mm) diameter sieve and 450 g for a 12 in (305 mm) diameter sieve. The amount of material retained on a sieve may be regulated by (1) the introduction of a sieve with larger openings immediately above the given sieve or (2) testing the sample in a number of increments.

**6.3.** In the case of coarse and fine aggregate mixtures, the portion of the sample finer than the No. 4 (4.75 mm) sieve may be distributed among two or more sets of sieves to prevent overloading of individual sieves.

**6.3.1.** Alternatively, the portion finer than the No. 4 (4.75 mm) sieve may be reduced in size using a mechanical splitter according to **KT-01, Section 4.2.** If this procedure is followed, compute the mass of each size increment of the original sample as outlined in **Section 7.2.** of this test method.

**6.4.** Determine the mass of each sieve size increment to the nearest 0.1% of the total original dry mass of sample (as defined in **Section 5.1.** of this test method) by weighing on a scale or balance conforming to the requirements specified in **Section 3.1.** of this test method. The total mass of the material after sieving should check closely with the original mass of sample placed on the sieves. If the amounts differ by more than 0.3%, based on the original mass of sample placed on the sieves, the results should not be used for acceptance purposes.

**6.5.** If the sample has previously been tested by **KT-03**, add the mass finer than the No. 200 (75 µm) sieve determined by that method to the mass passing the No. 200 (75 µm) sieve by sieving of the same sample in this method.

## 7. CALCULATIONS

**7.1** Calculate the total percent of material retained on each sieve as follows:

Percent Retained=

$$\frac{100 (\text{Mass Retained})}{\text{Total Original Dry Mass of Sample}}$$

Percent Passing No. 200 (75 µm)=

$$\frac{100 (\text{Sum of material Passing No. 200 (75 } \mu\text{m) by Sieve and Wash )}}{\text{Total Original Dry Mass of Sample}}$$

7.2. Instructions for using split sample procedure (**KDOT Form #645**):

7.2.1. Record the total dry mass of sample before separation as A.

7.2.2. Record the total dry mass of material retained on No. 4 (4.75 mm) sieve following separation as B.

7.2.3. Record the total dry mass of material passing the No. 4 (4.75 mm) sieve following separation as C.

$$C = A - B$$

7.2.4. Record reduced mass of material passing the No. 4 (4.75 mm) sieve as D.

7.2.5. Compute percent of material passing the No. 4 (4.75 mm) sieve as follows:

$$E = \frac{100(C)}{A}$$

Where: E = percent of material passing the No. 4 (4.75 mm) sieve in the total sample.

7.2.6. Wash the plus No. 4 (4.75 mm) portion of the sample over the No. 200 (75  $\mu$ m) sieve as specified in **KT-03**, dry to a constant mass. Weigh and record the mass. Conduct sieve analysis using all regular sieves including the No. 200 (75  $\mu$ m). Compute the percent of material retained on each sieve as follows:

$$G = \frac{100(F)}{A}$$

Where: G = Total percent of the entire sample that is retained on each sieve.  
F = Total mass of the plus No. 4 (4.75mm) material retained on each sieve size.

Calculate the total percent of material finer than the No. 200 (75  $\mu$ m) sieve for the plus No. 4 fraction of the original sample by adding the mass determined by **KT-03** to the mass passing the No. 200 (75  $\mu$ m) sieve by dry sieving, multiplying by 100 and divide by total dry mass of the sample before separation:

$$Q = \frac{100(\text{Sum of material Passing No. 200 (75 } \mu\text{m) by Sieve and Wash)}}{A}$$

Where: Q = Total percent of the plus No. 4 (4.75 mm) sieve passing the No. 200 (75  $\mu$ m) sieve.

7.2.7. Wash the reduced sample of minus No. 4 (4.75 mm) material over a No. 200 (75  $\mu$ m) sieve as specified in **KT-03**, dry to a constant mass. Weigh and record the mass. Conduct sieve analysis using all regular sieves including the No. 200 (75  $\mu$ m). Compute the total percent of the reduced minus No. 4 (4.75 mm) sample retained on each sieve as follows:

$$J = \frac{100(H)}{D}$$

Where: J = Total percent of the reduced minus No. 4 (4.75 mm) sample retained on each sieve.

H = Total mass of the reduced minus No. 4 (4.75 mm) material retained on each sieve.  
D = Total dry mass of reduced minus No. 4 (4.75 mm).

Calculate the total percent of material finer than the No. 200 (75 µm) sieve for the plus No. 4 (4.75 mm) fraction of the original sample by adding the mass determined by **KT-03** to the mass passing the No. 200 (75 µm) sieve by dry sieving, multiplying by 100 and divide by total dry mass of reduced minus No. 4 (4.75 mm):

$$S = \frac{100(\text{Sum of material Passing No. 200 (75 } \mu\text{m) by Sieve and Wash)}}{D}$$

Where: S = Total percent of reduced minus No. 4 (4.75 mm) material passing the No. 200 (75 µm) sieve

**7.2.8.** Calculate the adjusted percent retained on each size sieve for the minus No. 4 (4.75 mm) material as follows:

$$K = \frac{(J)(E)}{100}$$

Where: K = Adjusted percent of minus No. 4 (4.75 mm) material.  
J = Total percent of reduced minus No. 4 (4.75 mm) sample retained on each sieve.  
E = Percent of minus No. 4 (4.75 mm) material in total sample.

**7.2.9.** Calculate the combined percentage of material retained on each sieve in the series as follows:

$$R = K + G$$

**7.2.10** Calculate the total material finer than the No. 200 (75 µm) sieve for the original sample as follows:

$$\text{Total \% Passing No. 200 (75 } \mu\text{m) Sieve} = Q + \frac{(S)(E)}{100}$$

**7.2.11.** Record the sieve analysis on the proper KDOT form.

**NOTE:** The use of the “Work Sheet for Split Sample Gradation and Plastic Index Tests”, **KDOT Form No. 645**, is provided for the above calculations.

## 8. REPORTING

The results of the sieve analysis and, when required, the percent passing the No. 200 (75  $\mu$ m) sieve by the Wash Method (KT-03) are reported on appropriate KDOT forms. Report gradation test results to the nearest whole percent, except when the percentage passing the No. 200 (75  $\mu$ m) sieve is less than 10%. In this case, both the percentage passing the No. 200 (75  $\mu$ m) sieve and the material retained on the No. 200 (75  $\mu$ m) sieve shall be reported to the nearest 0.1%. Note that some specifications require these values be reported to the 0.01% such as asphalt mix gradations. The project number, name of producer, location of deposit, and all other pertinent data are shown on each report.

The first aggregate report issued for each project shall list the laboratory number under which the latest Official Quality Sample was tested and the results of such tests with the exception that specific gravities will be reported only if required by the specification. Subsequent reports may list only the laboratory number which the quality tests were conducted.

## 9. PRECISION

Precision for sieving aggregates are established in **TABLE 2**. The estimates for precision are based on results from the AASHTO Materials Reference Laboratory Reference Sample Program.

**TABLE 2**

	Total percentage of Material Passing	Standard Deviation (1S), %	Acceptable Range of Two Results (D2S), %
<b>Coarse Aggregates:</b>			
Single-Operator Precision			
	<100 $\geq$ 95	0.32	0.9
	<95 $\geq$ 85	0.81	2.3
	<85 $\geq$ 80	1.34	3.8
	<80 $\geq$ 60	2.25	6.4
	<60 $\geq$ 20	1.32	3.7
	<20 $\geq$ 15	0.95	2.7
	<15 $\geq$ 10	1.00	2.8
	<10 $\geq$ 5	0.75	2.1
	<5 $\geq$ 2	0.53	1.5
	<2 $\geq$ 0	0.27	0.8
Multilaboratory Precision			
	<100 $\geq$ 95	0.35	1.0
	<95 $\geq$ 85	1.37	3.9
	<85 $\geq$ 80	1.92	5.4
	<80 $\geq$ 60	2.82	8.0
	<60 $\geq$ 20	1.97	5.6
	<20 $\geq$ 15	1.60	4.5
	<15 $\geq$ 10	1.48	4.2
	<10 $\geq$ 5	1.22	3.4
	<5 $\geq$ 2	1.04	3.0
	<2 $\geq$ 0	0.45	1.3
<b>Fine Aggregates:</b>			
Single-Operator Precision			
	<100 $\geq$ 95	0.26	0.7
	<95 $\geq$ 60	0.55	1.6

	<60 ≥20	0.83	2.4
	<20 ≥15	0.54	1.5
	<15 ≥10	0.36	1.0
	<10 ≥2	0.37	1.1
	<2 ≥0	0.14	0.4
Multilaboratory Precision			
	<100 ≥95	0.23	0.6
	<95 ≥60	0.77	2.2
	<60 ≥20	1.41	4.0
	<20 ≥15	1.10	3.1
	<15 ≥10	0.73	2.1
	<10 ≥2	0.65	1.8
	<2 ≥0	0.31	0.9

**NOTE:** These numbers represent, respectively, the (1S and D2S) as describe in **ASTM C670**. The precision estimates are based on coarse aggregates with nominal maximum size of 3/4 in (19.0 mm).

## 10. VERIFICATION OF MECHANICAL SIEVE SHAKER EFFICIENCY

**10.1.** The following procedure defines a methodology to verify the efficiency of mechanical sieve shaker equipment. This procedure should be applicable to any manufacturers mechanical sieve shaker but has not been verified internally at KDOT.

**10.1.1.** Shaker efficiency is a requirement for all acceptance testing of fine and coarse aggregate and should be determined based on each product type. As aggregate production and mining operations can cause a change to aggregate properties (soundness, durability, angularity and specific gravity), re-evaluation of shaker efficiency shall be required.

**10.1.2.** Measurement of shaker efficiency is required for all sieves 12-in. diameter or smaller.

**NOTE** – Screens larger than 12-in. diameter, i.e. 14 x14 in. or 16 x 24 in., are typically used for aggregate separation and accurate measurement of sieving efficiency may be difficult to determine.

**10.1.3.** Nest the sieves, No. 4 and smaller, according to product being evaluated. Fit the sieve nest with a lid and a pan.

**10.1.4.** Determine the initial mass of the sample and shake for 6 minutes or by the time established by product history.

**10.1.5.** Determine and record the percent retained of each sieve size. Verify the material on each sieve does not exceed the maximum allowable mass per **6.2**. If overloaded, repeat using an adjusted sample mass.

**10.1.6.** Collect and recombine all of the material.

**10.1.7.** Re-shake the collected material using the same shaker and settings and increase the time by 1 minute.

**10.1.8.** Determine and record the percent retained of each sieve size.

**10.1.9.** Compare the percent retained to the percent retained in 10.1.5. The difference between two percent retained values on any sieve shall not exceed 0.5 percent by mass. If the difference between the two percent

retained values on any screen exceeds 0.5 percent by mass, then increase the shaker time another minute and repeat the process until the requirement can be met.

**10.1.10.** Record the minimum shaker time in which the requirement outlined in 10.1.9 is met as the established shaker time for the aggregate product being evaluated. This established shake time shall be used for testing this product in accordance with the procedure established in **Section 6**. For example, if the requirement was met when placed in the shaker for 6 and then 7 minutes, then the 6 minute time on the shaker provides adequate sieving.

## **11. HAND SIEVING (OPTIONAL)**

**11.1.** Sieving for a sufficient period and in such a manner that, after completion, not more than 0.5% by mass of the total sample passes any sieve during one minute of continuous hand sieving performed as follows: Hold the individual sieve, provided with a snug fitting pan and cover, in a slightly inclined position in one hand. Strike the side of the sieve sharply and with an upward motion against the heel of the other hand at the rate of about 150 times per minute, turn the sieve about one-sixth of a revolution at intervals of about 25 strokes. In determining sufficiency of sieving for sizes larger than the No. 4 (4.75 mm) sieve, limit the material on the sieve to a single layer of particles. If the size of the mounted testing sieves makes the described sieving motion impractical, use 8 in (203 mm) diameter sieves to verify the sufficiency of sieving.

**11.2.<sup>1</sup>** An alternative to maintain a snug fitting pan and cover is to sieve the material over an oversized pan. The pan must be large enough to ensure all material is retained during the hand sieving process. Any material leaving the sieve over the top of the rim must be returned to the sieve.

**11.3.** Once hand sieving is complete return to **Section 6.4** to complete the test procedure.

<sup>1</sup> **11.2.** is not found in **AASHTO T 27** but provides a realistic approach to monitoring material falling thru the sieve.

D.O.T. Form No. 645

5.9.03 MATERIAL PASSING NO. 200 (75µm) SIEVE BY THE WASH METHOD  
(Kansas Test Method KT-03)

**1. SCOPE**

This method of test covers the procedure for determining the quantity of material finer than the No. 200 (75µm) sieve in aggregate by the wash method. It should be recognized that this procedure will not determine the total amount of material finer than the No. 200 (75µm) sieve and that the total amount must be determined by a combination of washing, drying and re-screening as outlined in **KT-02** of this manual. **KT-03** reflects testing procedures found in **AASHTO T 11**.

**2. REFERENCED DOCUMENTS**

**2.1.** Part V, 5.9; Sampling and Test Methods Foreword

**2.2.** KT-02; Sieve Analysis of Aggregates

**2.3.** KT-07; Clay Lumps and Friable Particles in Aggregate

**2.4.** ASTM E11; Woven Wire Test Sieve Cloth and Test Sieves

**2.5.** AASHTO T 11; Materials Finer Than No. 200 (75µm) Sieve in Mineral Aggregates by Washing

**3. APPARATUS**

**3.1.** A nest of two sieves, the lower being a No. 200 (75µm) sieve and the upper being a sieve with openings in the range of No. 8 (2.36 mm) to No. 16 (1.18 mm), both conforming to the requirements of **ASTM E11**.

**3.2.** A pan or vessel of a size sufficient to contain the sample covered with water and to permit vigorous agitation without loss of any part of the sample or water.

**NOTE:** Pans or vessels shall be solid construction and not contain a screen through which the sample or wash water can pass through.

**3.3.** Drying pans.

**3.4.** The balance shall conform to the requirements of **Part V, 5.9, Sampling and Testing Methods Foreword** for the class of general purpose balance required for the principal sample mass of the sample being tested.

**3.5.** Oven capable of maintain uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**3.6. Wetting Agent**—Any dispersing agent, such as liquid dishwashing detergents, that will promote separation of the fine materials.

**NOTE:** The use of a mechanical apparatus to perform the washing operation is not precluded, provided the results are consistent with those obtained using manual operations. The use of some mechanical washing equipment with some samples may cause degradation of the sample.

#### 4. TEST SAMPLE

Select the test sample from material that has been thoroughly mixed. Except for plant dried aggregate, the material from which the sample is selected should contain sufficient moisture to prevent segregation. Select a representative sample of sufficient size to yield not less than the mass of dried material shown in **Table 1**.

**Table 1**  
**Sample Size for Determination of Percent of Material**  
**Passing No. 200 (75 µm) Sieve by Washing**

Sieve Size	Minimum Mass of Samples (g)
1 1/2 in (37.5 mm) or more	5,000
3/4 in (19.0 mm)	2,500
3/8 in (9.5 mm)	1,000
No. 4 (4.75 mm) or less	300

**NOTE:** To select the sample size, use the largest sieve on which 5% or more of material is specified to be retained.

**NOTE:** Monitor test samples for clay lumps. The percent of clay lumps permitted in these aggregates is covered by a separate specification for the following materials and the method of determination is covered by **KT-07**:

- Concrete (except lightweight aggregate).
- Underdrain.
- Cover Material.
- Subgrade Modification or Reconstruction.
- Surfacing or Resurfacing.
- Surfacing or Subgrade Modification for Secondary Roads.
- Crushed Stone for Backfill.

#### 5. TEST PROCEDURE

**5.1.** Dry the sample to constant mass at a temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ). Determine the mass of the sample to the nearest 0.1%. Record this as the total original dry mass of sample.

**5.2.** Place the test sample in the container. Add sufficient water to cover the sample, and add wetting agent to the water. Agitate the sample with sufficient vigor to result in complete separation of all particles finer than the No. 200 (75-µm) sieve from the coarser particles, and to bring the fine material into suspension. The use of a large spoon or other similar tool to stir and agitate the aggregate in the wash water has been found satisfactory. Immediately pour the wash water containing the suspended and dissolved solids over the nested sieves, as described in **Section 3.1** of this test method, arranged with the coarser sieve on top. Take care to avoid, as much as feasible, the decantation of coarser particles of the sample.

**NOTE:** There should be enough wetting agent to produce a small amount of suds when the sample is agitated. The quantity will depend on the hardness of the water and the quality of the detergent. Excessive suds may overflow the sieves and carry some material with them.

**5.3.** Add a second charge of water (without wetting agent) to the sample in the container, agitate, and decant as before. Repeat this operation until the wash water is clear.

**NOTE:** A spray nozzle or a piece of rubber tubing attached to a water faucet may be used to rinse any of the material that may have fallen onto the sieves. The velocity of water, which may be increased by pinching the tubing or by use of a nozzle, should not be sufficient to cause any splashing of the sample over the sides of the sieve.

Return all material retained on the nested sieves by flushing to the washed sample.

Following the washing of the sample and flushing any materials retained on the No. 200 (75 µm) sieve back into the container, no water should be decanted from the container except through the No. 200 (75 µm) sieve, to avoid loss of material. Excess water from flushing should be evaporated from the sample in the drying process.

If mechanical wash equipment is used, the charging of water, agitating, and decanting may be a continuous operation.

**5.4.** Dry all material retained to constant mass at a temperature of approximately 230 ± 9°F (110 ± 5°C). Weigh the sample to the nearest 0.1% of the total original dry mass of sample. Record this as the final dry mass. Note that the final dry mass is the same as the original mass of the sample placed on the sieves in KT-02.

## 6. CALCULATIONS

Calculate the results by use of the following formula:

$$P = \frac{100(\text{ODM} - \text{FDM})}{\text{ODM}}$$

Where: P = Percent of material finer than No. 200 (75 µm).  
ODM= Original Dry Mass.  
FDM= Final Dry Mass (after washing).

## 7. CHECK DETERMINATIONS

When check determinations are desired either evaporate the wash water to dryness or filter it through tared filter paper which shall subsequently be dried and the residue weighed. Calculate the percentage by use of the following formula:

$$P = \frac{100(\text{MR})}{\text{ODM}}$$

Where: P = Percent of material finer than No. 200 (75 µm).  
MR= Mass of Residue.  
ODM= Original Dry Mass.

## 8. REPORT

Record the material passing the No. 200 (75  $\mu\text{m}$ ) sieve by the wash method to 0.1% of the total original dry mass of sample.

Report the percentage of material finer than the No. 200 (75  $\mu\text{m}$ ) sieve by washing to the nearest 0.1%, except if the result is 10% or more, report the percentage to the nearest whole number.

## 9. PRECISION

The estimates for precision of this test method are based on the results from the **AASHTO Materials Reference Laboratory Proficiency Sample Program** and are presented in **Table 2**.

**Table 2**

	Standard Deviation (1S), Percent	Acceptable Range of two Results (D2S), Percent
Coarse aggregate:		
Single operator precision	0.10	0.28
Multilaboratory precision	0.22	0.62
Fine aggregate:		
Single operator precision	0.15	0.43
Multilaboratory precision	0.29	0.82

5.9.04 PERCENT RETAINED ON THE NO. 200 (75 µm) SIEVE BY DRY SCREENING  
(Kansas Test Method KT-04)

**1. SCOPE**

This method of test covers the procedure for determining the amount of material retained on the No. 200 (75 µm) sieve by dry screening only.

**NOTE:** When the percent retained on the No. 200 (75 µm) sieve by dry screening is part of the project specifications, it is common practice to conduct **KT-04** followed by **KT-02** on the sample.

**2. REFERENCED DOCUMENTS**

**2.1.** Part V, 5.9; Sampling and Test Methods Foreword

**2.2.** KT-02; Sieve Analysis of Aggregates

**2.3** ASTM E11; Woven Wire Test Sieve Cloth and Test Sieves

**3. APPARATUS**

**3.1.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

**3.2.** Sieves meeting **ASTM E11** of specified sizes for the aggregate being tested.

**3.3.** Oven capable of maintaining a uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**3.4.** Drying pans.

**4. TEST SAMPLES**

**4.1.** Obtain samples of plant-mixed aggregate from the dried, pugmill mixed material and road mixed material from the combined windrow. The original sample before splitting shall weigh approximately 75 lb (35 kg).

**4.2.** Reduce sample by quartering or splitting before further drying to a mass of not less than the amount shown in **Table 1**. Exercise extreme care to prevent segregation and/or degradation during the splitting operation.

**TABLE 1**  
**Sample Size for Determination of Percent of**  
**Material Passing No. 200 (75  $\mu$ m) Sieve of Dry Screening**

*Sieve Size	Samples (g)
1 1/2 in (37.5 mm) or more	15,000
1 in (25.0 mm)	10,000
3/4 in (19.0 mm)	5,000
1/2 in (12.5 mm)	2,500
3/8 in (9.5 mm) or less	1,000

\*To select the sample size, use the largest sieve on which 5% or more of the material is specified to be retained.

## **5. DRYING OF SAMPLES**

**5.1.** After reducing the Road Mixed Project samples to the size indicated, dry it to constant mass at  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ). Measure the temperature, do not allow the tip of the thermometer to come in contact with the pan bottom. Do not manipulate or stir the material during the drying phase. Upon reaching a constant mass condition allow the sample to cool to room temperature before proceeding with the test.

## **6. TEST PROCEDURE**

**6.1.** The sample prepared as above shall be accurately weighed and sieved through the sieve series in the applicable specification. Conduct the sieving operation by means of a lateral and vertical motion accompanied by a jarring action to keep the sample moving continuously over the surface of the sieve. (In no case shall fragments in the sample be turned or manipulated through the sieve by hand nor shall a coin or other foreign object be placed in the sieve along with the sample to aid in sieving operation). Continue sieving until no more than 0.5% by mass of the residue passes any sieve (except the No. 100 and No. 200 (150 and 75  $\mu$ m) during one minute. Continue sieving operation for the No. 100 and No. 200 (150 and 75  $\mu$ m) sieves until not more than 0.5% by mass of the residue passes each individual sieve during a two minute period. When mechanical sieving is used, the thoroughness of sieving shall be tested by using the hand method of sieving as described above. Before using a mechanical shaker, in addition to hand shaking, for production control, comparison test should be run to check the results against hand shaking only. The time on the mechanical shaker should be adjusted so that the same results are obtained as by the hand method.

**6.2.** In no case shall the fraction retained on any sieve at the completion of the sieving operation weigh more than 4 g/in<sup>2</sup> (7 kg/m<sup>2</sup>) of sieving surface. (This amounts to 200 grams on the 8 in (200 mm) diameter sieve). This may be accomplished by removing excess material from the screen, placing it in a suitable container, sieving the material remaining on the screen, then sieving the material retained in the container.

## 7. CALCULATIONS

7.1. The percent retained on the No. 200 (75 µm) by dry screening is calculated as follows:

$$\frac{100 (A)}{B}$$

Where:        A= Mass of the retained fraction of the original sample as determined by dry screening only, over a No. 200 (75 µm) sieve.  
                  B= Original dry mass of sample.

## 8. REPORTING

Report test results to the nearest whole percent, except for when the percentage retained on the No. 200 (75 µm) sieve is less than 10%, it shall be reported to the nearest 0.1% , unless otherwise directed (most asphalt mix gradations are rounded to the nearest 0.01%). The project number, name of producer, location of deposit and all other pertinent data are shown on each report.

The first aggregate report issued for each project shall list the laboratory number under which the latest Official Quality Sample was tested and the results of such tests with the exception that specific gravities will be reported only if required by the specification. Subsequent reports may list only the laboratory number under which the quality tests were conducted.

## 5.9.05 UNIT WEIGHT OF AGGREGATE (Kansas Test Method KT-05)

### 1. SCOPE

This method of test covers the procedures for determining the unit weight of fine, coarse, or mixed aggregates. The method is applicable to aggregates not exceeding 1 1/2 in (37.5 mm) in nominal maximum size<sup>1</sup>. **KT-05** reflects testing procedures found in **AASHTO T 19**.

**NOTE:** Unit weight is the traditional terminology used to describe the property determined by this test method. Some believe the proper term is unit mass or density or bulk density, but consensus on this alternate terminology has not been obtained.

### 2. REFERENCED DOCUMENTS

**2.1.** Part V, 5.9; Sampling and Test Methods Foreword

**2.2.** KT-06; Specific Gravity and Absorption of Aggregates

**2.3.** KT-15; Bulk Specific Gravity and Unit Weight of Compacted Hot Mix Asphalt (HMA)

**2.4.** KT-20; Mass per Cubic Foot (Meter), Yield and Air Content (Gravimetric) of Freshly Mixed Concrete

**2.5.** AASHTO T 19; Bulk Density ( "Unit Weight") and Voids in Aggregate

### 3. APPARATUS

**3.1.** The balance shall conform to the requirements of **Part V, Section 5.9; Sampling and Test Methods Foreword** for the class of general purpose required for the principal sample mass of the sample being tested.

**3.2.** Tamping Rod: A straight steel rod, 5/8 in (16 mm) in diameter and approximately 24 in (600 mm) in length, having the tamping end rounded to a hemispherical tip.

**3.3.** Cylindrical measure shall be provided with a handle and be watertight. The top rim shall be smooth and plane within 0.01 in (0.25 mm) and shall be parallel to the bottom within 0.5 degrees (0.1592 rads). The 0.5ft<sup>3</sup> (0.014m<sup>3</sup>) measure shall be reinforced around the top with a band or rim and shall conform to the following dimensional requirements:

**TABLE 1**  
**Cylindrical Measure Requirements for Unit Weight**

Overall Measurements		Wall Thickness of Measure	
Capacity	0.5 ft <sup>3</sup> (0.014 m <sup>3</sup> )	Bottom	0.20 in (5.0 mm)
Inside Diameter	10.0 in (254 mm)	Side	0.12 in (3.0 mm)
Inside Height	11.0 in (280 mm)	Top Rim	0.20 in (5.0 mm)

---

<sup>1</sup> **AASHTO T 19** provides for aggregates up to 6 in (150 mm) in Table 1. Under KDOT aggregate specifications, 1 1/2 in (37.5 mm) represents the maximum size aggregate permitted.

**NOTE:** The top rim is satisfactorily planed if a 0.01 in (0.25 mm) feeler gage cannot be inserted between the rim and a piece 1/4 in (6 mm) or thicker plate glass laid over the measure. The top and bottom are satisfactorily parallel if the slope between pieces of plate glass in contact with the top and bottom does not exceed 0.87% in any direction.

#### **4. CALIBRATION OF MEASURE**

Calibrate the measure as set forth in **KT-20, Section 4**. Obtain the factor for any unit by dividing the unit weight of water (as defined in **Table 1 in KT-15, Section 5.4.**) by the mass of water required to fill the measure.

#### **5. SAMPLE**

The size of the sample shall be approximately 125 to 200% of the quantity required to fill the measure, and shall be handled in a manner to avoid segregation. Dry the sample of aggregate to essentially constant mass, preferably in an oven  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

#### **6. TEST PROCEDURE (RODDED WEIGHT)<sup>2</sup>**

**6.1.** Weigh the measure empty, fill the measure one-third full and level the top of the sample with the fingers. Rod the layer with 25 strokes of the tamping rod evenly distributed over the surface. Fill the measure to two-thirds full, level and rod with 25 strokes. Fill the measure to overflowing, rod 25 times, and strike off the surplus aggregate using the tamping rod as a straight edge in such a way that any slight projections of the larger pieces of the coarse aggregate approximately balance the larger voids in the surface below the top of the measure. In rodding the first layer, do not permit the rod to forcibly strike the bottom of the measure. In rodding the second and final layers use only enough force to cause the tamping rod to just penetrate the previous layer of the aggregate placed in the measure.

**6.2.** Determine the net mass of the aggregate in the measure to the nearest 0.1 lb (50 g).

**6.3.** Calculate the unit weight of the aggregate by multiplying the net mass of the aggregate by the factor found as described in **Section 4** of this test method.

#### **7. TEST PROCEDURE (LOOSE MASS FOR LIGHT WEIGHT AGGREGATE)**

**7.1.** Fill the calibrated measure to overflowing by means of a shovel or scoop, discharging the aggregate from a height not to exceed 2 in (50 mm) above the top of the measure. Exercise care to prevent, so far as possible, segregation of the particle sizes of which the sample is composed. Level the surface of the aggregate with the fingers or a straightedge in such a way that any slight projections of the larger pieces of the coarse aggregate approximately balance the larger voids in the surface below the top of the measure.

**7.2.** Determine the mass of the measure and its content and record the net mass of the aggregate to the nearest 0.1%. Using the calibration factor of the measure, determine the loose unit mass of the aggregate.

---

<sup>2</sup> **AASHTO T 19** also has jiggling and shoveling procedures to determine the unit weight of the aggregate. These procedures are not permitted under **KT-05**.

## 8. BULK DENSITY AND AIR VOIDS CALCULATIONS

**8.1.** Bulk Density-Calculate the bulk density as follows:

$$M = (G - T)/V$$

Or

$$M = (G - T) \times F$$

Where: M=bulk density of aggregate, lb/ft<sup>3</sup> (kg/m<sup>3</sup>).  
G=mass of aggregate plus the measure, lb (kg).  
T=mass of the measure, lb (kg).  
V=volume of measure, ft<sup>3</sup> (m<sup>3</sup>).  
F=factor for measure, ft<sup>-3</sup> (m<sup>-3</sup>).

**8.2.** The bulk density determined by this method is for aggregate in an oven-dry condition. If the bulk density in terms of saturated-surface dry (SSD) condition is desired, use the exact procedure in this method, and then calculate the SSD bulk density by the following formula:

$$M_{SSD}=M[1+(A/100)]$$

Where: M<sub>SSD</sub>=bulk density in SSD condition, lb/ft<sup>3</sup> (kg/m<sup>3</sup>); and  
A=absorption, percent, determined in accordance with **KT-06, Section 3.3.4 and 4.3.5.**

**8.3.** Void Content- Calculate the void content in the aggregate using the bulk density as follows:

$$\text{Voids \%} = \frac{100[(S \times W) - M]}{S \times W}$$

Where: M=bulk density aggregate, lb/ft<sup>3</sup> (kg/m<sup>3</sup>)  
S=bulk specific gravity (dry basis) as determined in accordance with **KT-06**; and  
W=density of water as established in **Table 1** in **KT-15, Section 5.4.**

## 9. REPORT

Record to the nearest 50 g, 0.1 lb. or 0.1% of mass and the bulk density to the nearest 0.1 lb/ft<sup>3</sup> (1 kg/m<sup>3</sup>). Report the results for bulk density (unit weight) to the nearest 1 lb/ft<sup>3</sup> (10 kg/m<sup>3</sup>).

## 10. PRECISION

The following estimates of precision for this method are based on results from the **AASHTO re:source Proficiency Sample Program (AASHTO T 19, Section 15. Precision and Bias):**

**TABLE 2**  
**Precision for Unit Weight Test Procedure**

Coarse Aggregate	1S lb/ft <sup>3</sup> (kg/m <sup>3</sup> )	D2S lb/ft <sup>3</sup> (kg/m <sup>3</sup> )	Fine Aggregate	1S lb/ft <sup>3</sup> (kg/m <sup>3</sup> )	D2S lb/ft <sup>3</sup> (kg/m <sup>3</sup> )
Single Operator Precision	0.88 (14)	2.5 (40)	Single Operator Precision	0.88 (14)	2.5 (40)
Multilaboratory Precision	1.87 (30)	5.3 (85)	Multilaboratory Precision	2.76 (44)	7.8 (125)

## 5.9.06 SPECIFIC GRAVITY AND ABSORPTION OF AGGREGATES (Kansas Test Method KT-06)

### **1. SCOPE**

This method of test covers the procedures for determining the specific gravity and absorption of aggregates. Coarse aggregate (Procedure I) represents aggregate retained on the No. 4 (4.75 mm) sieve. Fine aggregate (Procedure II) is all aggregate passing the No. 4 (4.75 mm) and retained on the No.100 (150 µm) sieve. **KT-06** reflects testing procedures found in **AASHTO T 84** and **T 85**.

### **2. REFERENCED DOCUMENTS**

**2.1.** Part V, 5.9; Sampling and Test Methods Foreword

**2.2** KT-01; Sampling and Splitting of Aggregates

**2.3.** KT-11; Moisture Tests

**2.4.** KT-24; Determination of Free Moisture or Absorption of Aggregate for Use in Concrete

**2.5.** ASTM E11; Woven Wire Test Sieve Cloth and Test Sieves

**2.6.** AASHTO T 84; Specific Gravity and Absorption of Fine Aggregate

**2.7.** AASHTO T 85; Specific Gravity and Absorption of Coarse Aggregate

**2.8.** ASTM C128; Method for Density, Relative Density (Specific Gravity), and Absorption of Fine Aggregate

**2.9.** ASTM C670; Practice for Preparing Precision and Bias Statements for Test Methods for Construction Materials

### **3. PROCEDURE I: COARSE AGGREGATE**

#### **3.1. Apparatus**

**3.1.1.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, Class G5. The balance shall be equipped with suitable apparatus for suspending the sample container in water from the center of weighing platform or pan of the balance.

**3.1.2.** Bucket approximately 8 in (200 mm) in diameter and 8 in (200 mm) in height.

**3.1.3.** Container with overflow for immersing the bucket in water.

**3.1.4.** Drying oven capable of maintaining a uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**3.1.5.** Drying pans.

**3.1.6.** Absorbent cloth.

**3.1.7.** Standard No. 4 (4.75 mm) sieve meeting the requirements of **ASTM E11**.

## 3.2. Test Method

**3.2.1. Sample Preparation:** This test is normally conducted on the portion of the aggregate that passes the 2 in (50 mm) sieve and is retained on the No. 4 (4.75 mm) sieve. If the test is conducted on larger size particles, it shall be so noted on the test report.

**3.2.1.1.** Select a portion of the aggregate by splitting or quartering as specified in **KT-01, Section 4**. The minimum mass of the sample, all of which passes the 2 in (50 mm) sieve and is retained on the No. 4 (4.75 mm) sieve, shall be as set out in the following **Table 1**:

**Table 1**  
**Minimum Sample Size for Coarse Aggregate**

Sieve Size	Minimum Mass of Samples (g)
1 1/2 in (37.5 mm) or more	5,000
1 in (25.0 mm)	4,000
3/4 in (19.0 mm)	3,000
1/2 in (12.5 mm) or less	2,000

**NOTE:** To select the sample size, use the largest sieve on which 5% or more of the material is specified to be retained.

**3.2.1.2.** Thoroughly wash<sup>1</sup> the sample over the No. 4 (4.75 mm) sieve to remove dust and other adherent coatings.

**3.2.1.3.** Dry the sample to a constant mass in the oven at a constant temperature of  $230 \pm 9^\circ\text{F}$  ( $110 \pm 5^\circ\text{C}$ ).

**NOTE:** If the absorption and specific gravity values will be used as a basis for the design of concrete mixes where aggregates are used in a moist condition, this drying procedure may be eliminated. For an aggregate that has been in contact with water and that has free moisture on the particle surfaces, the percentage of free moisture can be determined by deducting the absorption from the total moisture content determined by **KT-11 Section 5.1**. Free moisture can also be calculated as described in **KT-24 Section 6**.

## 3.2.2. Procedure

**3.2.2.1.** Immerse the sample in water<sup>2</sup> and stir vigorously. Soak for a period of  $24 \pm 4$  hours.

**3.2.2.2.** Remove the sample from the water and bring to a saturated surface-dry condition by rolling the sample in a dampened, absorbent cloth. (For the purpose of this test, a saturated surface-dry condition of the aggregate has been reached when the particle surface appears to be moist but not shiny.)

**3.2.2.3.** Weigh the sample immediately after obtaining the saturated surface-dry condition. Record this value as "B". All masses determined in this test shall be to the nearest 1 g or 0.1% of the sample mass, whichever is greater.

---

<sup>1</sup> AASHTO T 85 requires dry sieving and then thoroughly wash to remove dust or other coatings from the surface.

<sup>2</sup> AASHTO T 85 requires the sample to be dried to constant mass prior to immersing in water for a period of 15 to 19 hours.

**3.2.2.4.** Immediately after obtaining the saturated surface-dry mass, immerse the sample in water, stir to remove any entrapped air and weigh. Record this value as “C”. The water temperature shall be  $77 \pm 2^{\circ}\text{F}$  ( $25 \pm 1^{\circ}\text{C}$ )<sup>3</sup>.

**3.2.2.5.** Dry the sample to a constant mass at a temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**3.2.2.6.** Cool the sample at room temperature, until aggregate has cooled to a temperature that is comfortable to handle and determine the mass. Record this value as “A”.

### **3.3. Calculations**

Where:        A= Mass of oven-dry sample in air, g  
                  B= Mass of surface-dry sample in air, g  
                  C= Mass of saturated sample in water, g

**3.3.1.** Bulk Specific Gravity:

$$\frac{A}{B - C}$$

**3.3.2.** Bulk Specific Gravity Saturated Surface-Dry Basis:

$$\frac{B}{B - C}$$

**3.3.3.** Apparent Specific Gravity:

$$\frac{A}{A - C}$$

**3.3.4.** Absorption (%):

$$\frac{100 (B - A)}{A}$$

## **4. PROCEDURE II: FINE AGGREGATE**

### **4.1. Apparatus**

**4.1.1.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, Class G2.

**4.1.2.** Volumetric flask of known mass having a minimum capacity of 500mL and calibrated by the manufacturer to within:

- 0.20mL at 68°F (20°C) for a 500mL flask.
- 0.30mL at 68°F (20°C) for a 1000mL flask.

---

<sup>3</sup> **AASHTO T 85** requires the water temperature to be  $23 \pm 1.7^{\circ}\text{C}$  ( $73.4 \pm 3^{\circ}\text{F}$ ). Changing the temperature to  $25 \pm 1^{\circ}\text{C}$  ( $77 \pm 2^{\circ}\text{F}$ ) establishes a uniform temperature requirement on all water bath test-related procedures.

**4.1.3.** Not less than two drying pans with a bottom surface of the pan that will have no effect on the material and results but should allow for the presence of free moisture to be observed. A worn oxidized surface has been known to work well in showing the presence of free moisture. Other surfaces such as a worn aluminum pan or galvanized pan may also work. The pan should be flat, dry, clean and have a dull, non-absorbent surface.

**4.1.4.** Drying oven capable of maintaining a uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**4.1.5.** Water bath having a capacity of at least 2 gal (8 L) maintained at a temperature of  $77 \pm 2^{\circ}\text{F}$  ( $25 \pm 1^{\circ}\text{C}$ ) and a depth approximately equal to or above the height of the bowl of the volumetric flask.

**4.1.6.** Standard No. 4 (4.75 mm) sieve meeting requirements of **ASTM E11**.

**4.1.7.** Standard No.100 (150  $\mu\text{m}$ ) sieve meeting requirements of **ASTM E11**.

## **4.2. Test Method**

**4.2.1.** Sample Preparation: This test is conducted on that portion of aggregate passing the No. 4 (4.75 mm) and retained on the No.100 (150  $\mu\text{m}$ ) sieve.

**4.2.1.1.** Select a portion of the aggregate by splitting or quartering as established in **KT-01, Section 4**. The portion selected should be of sufficient size to yield a sample weighing approximately 1,000 g all of which passes the No. 4 (4.75 mm) sieve and retained on the No. 100 (150  $\mu\text{m}$ ) sieve.

**4.2.1.2.** Screen the portion selected over the No. 4 (4.75 mm) sieve and discard all material retained on that sieve.

**4.2.1.3.** Wash the minus No. 4 (4.75 mm) material [material passing the No. 4 (4.75mm) sieve] over the No. 100 (150  $\mu\text{m}$ ) sieve to remove dust.

**4.2.1.4.** Dry the plus No. 100 (150  $\mu\text{m}$ ) material [material retained on the No. 100 (150  $\mu\text{m}$ ) sieve] to a constant mass in the oven.

**NOTE:** If the absorption and specific gravity values will be used as a basis for the design of concrete mixes where aggregates are used in a moist condition, this drying procedure may be eliminated. For an aggregate that has been in contact with water and that has free moisture on the particle surfaces, the percentage of free moisture can be determined by deducting the absorption from the total moisture content determined by **KT-11 Section 5.1**. Free moisture can also be calculated as described in **KT-24 Section 6**.

## **4.2.2. Procedure**

**4.2.2.1.** Immerse the sample in water and stir vigorously. Soak for a period of  $24 \pm 4$  hours.

**4.2.2.2.** Remove the sample from the water and bring it to a saturated surface-dry condition<sup>4</sup>. The procedure to be used to obtain the surface-dry condition is as follows:

**4.2.2.2.1.** Place the saturated sample in a drying pan and allow to dry in air for a short time. Stir the sample regularly to ensure uniform drying.

---

<sup>4</sup> **AASHTO T 84 Section 7.2.1** uses the cone test for determining SSD condition. Under **NOTE 4 (2) Provisional Surface Test**, the use of alternative surfaces are permitted and represents the method presented in **Section 4.2.2**.

**4.2.2.2.2.** Transfer the sample to another drying pan. The surface of the pan may be of any surface that will have no effect on the material and results but should allow for the presence of free moisture to be observed.

**4.2.2.2.3.** Stir the sample and check for the presence of free moisture as indicated by a presence of moisture on the bottom surface of the pan. This can typically be seen by a change in color or the presence of a sheen of moisture on the surface of the pan.

**NOTE:** The first check should be conducted when there is some free moisture on the surface of the aggregate particles to ensure that a saturated surface-dry condition has not been passed. If no moisture is present, it is likely the SSD condition is passed, and the test must be restarted.

**4.2.2.2.4.** Stir the sample regularly and transfer it frequently from pan to pan until a saturated surface-dry condition is reached as indicated by the absence of free moisture on the bottom of the pan.

**4.2.2.2.5.** Determine the mass of the empty flask. Record the value as “F”.

**4.2.2.3.** Immediately split out and weigh a sample of the saturated surface-dry material weighing not less than 500 g. Record this value as “B”. Place the sample in the flask.

**4.2.2.4.** Fill the flask to a level slightly below the calibration mark with water at a temperature of  $77 \pm 2^{\circ}\text{F}$  ( $25 \pm 1^{\circ}\text{C}$ ).

**4.2.2.5.** Rotate the flask in an inclined position to eliminate all air bubbles. Do not shake. Allow the flask to sit for several minutes then roll flask again. Continue the process until there are no visible air bubbles present.

**NOTE:** Bubbles or foam may be dispelled by touching them carefully with a hot wire or the tip of a paper towel.

**4.2.2.6.** Place the flask in the water bath until the temperature of the material inside the flask is the same as that of the water bath.

**4.2.2.7.** Fill the flask to the calibrated mark, remove from the water bath and wipe all moisture from the outside surface.

**4.2.2.8.** Weigh the flask and its contents to the nearest 0.1 g. Record the value as “K”.

**4.2.2.9.** Remove the aggregate from the flask and dry to a constant mass in the oven at a temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**4.2.2.10.** Cool the sample to room temperature and weigh. Record the value as “A”.

**4.3.** Flask Verification – Perform minimum every 12 months - Determine the mass of flask filled to the calibration line with water at  $77^{\circ}\text{F}$  ( $25^{\circ}\text{C}$ ) and subtract the mass of the flask to determine the mass of water the flask will hold. Record this value as “C”. This step need not be performed for every test but must be done a minimum of once every 12 months.

#### **4.4. Calculations**

**4.4.1.**  $W = K - (F + B)$

#### 4.4.2. Bulk Specific Gravity:

$$\frac{A}{C - W}$$

#### 4.4.3. Bulk Specific Gravity (Saturated Surface-Dry Basis):

$$\frac{B}{C - W}$$

#### 4.4.4. Apparent Specific Gravity:

$$\frac{A}{(C - W) - (B - A)}$$

#### 4.4.5. Absorption (%):

$$\frac{100 (B - A)}{A}$$

Where:

- W= Mass of water added to the flask, g
- F= Mass of empty flask, g
- K= Mass of flask, plus sample, plus water (See step in **Section 4.2.2.8** above), g
- A= Mass of oven-dry sample in air, g
- B= Mass of saturated surface-dry sample in air, g
- C= Mass of water the flask will hold filled to the calibration line at 77°F (25°C)

## 5. REPORT

**5.1.** Record the specific gravities to the nearest 0.001. Record the absorption to the nearest 0.01%. Report all specific gravities to the nearest 0.001 and indicate the type of specific gravity. Report the absorption result to the nearest 0.1%.

## 6. PRECISION

**6.1.** The estimates of precision of this test method (listed in **Table 2**) are based on results from the **AASHTO Materials Reference Sample Program** with testing conducted by **AASHTO, T 84** and **T 85**, and **ASTM, C128** and **C670**. The significant difference between the methods is that ASTM requires a saturation period of  $24 \pm 4$  hours, and AASHTO requires a saturation period of 15 to 19 hours. This difference has been found to have an insignificant effect on the precision indices.

**Table 2**  
**Precision for Specific Gravities**  
**and Absorption of Aggregates**

	Coarse Aggregate			Fine Aggregate	
Single Operator Precision	1S	D2S	Single Operator Precision	1S	D2S
Bulk Specific Gravity (Dry)	0.009	0.025	Bulk Specific Gravity (Dry)	0.011	0.032
Bulk Specific Gravity (SSD)	0.007	0.020	Bulk Specific Gravity (SSD)	0.0095	0.027

## 7. ADDENDUM – SUPPLEMENTAL CALCULATION TO COMBINE AGGREGATE ABSORPTION

7.1. In a few special cases the specifications have an absorption requirement on each individual source. Procedures I and II are both used and the combined aggregate absorption must be calculated. (This calculation is not to be used when the specifications have an absorption requirement by Procedure I and/or Procedure II.

7.2. Absorption of the individual source equals:

Combined Absorption,  $A_{co}(\%)$ :

$$\frac{(AbS_c)(\%C) + (AbS_f)(\%I)}{100}$$

Where:

- $A_{co}$  = Combined Absorption, %
- $AbS_c$  = Absorption, Proc. I, %
- $AbS_f$  = Absorption, Proc. II, %
- $\%C$  = Percent plus No. 4 (4.75 mm) in each individual source
- $\%I$  = Percent minus No. 4 (4.75 mm) in each individual source

## 5.9.07 CLAY LUMPS AND FRIABLE PARTICLES IN AGGREGATE (Kansas Test Method KT-07)

### 1. SCOPE

This method of test covers the procedure of determining the percentage of clay lumps and friable particles in aggregate. Whenever mud balls and clay balls are referred to in specifications, they shall be considered as clay lumps. Clay lumps in aggregate shall be defined as any particles or aggregate of particles which when thoroughly wet, can be distorted when squeezed between the thumb and forefinger, or will disintegrate into individual grain sizes when immersed for a short period in water.

Friable particles are defined as particles which vary from the basic aggregate particles in that they may either readily disintegrate under normal handling and mixing pressures imposed upon them by construction procedures, or break down after being incorporated into the work. **KT-07** reflects testing procedures found in **AASHTO T 112**.

### 2. REFERENCED DOCUMENTS

**2.1.** Part V, 5.9; Sampling and Test Methods Foreword

**2.2** KT-03; Material Passing No. 200 (75  $\mu$ m) Sieve by the Wash Method

**2.3.** ASTM E11; Woven Wire Test Sieve Cloth and Test Sieves

**2.4.** AASHTO T 112; Clay Lumps and Friable Particles in Aggregate

### 3. APPARATUS

**3.1.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

**3.2.** Drying pans.

**3.3** Sieves conforming to **ASTM E11** requirements.

**3.4.** Oven providing free circulation of air and capable of maintaining a temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

### 4. SAMPLE PREPARATION

**4.1.** Aggregate for this test shall consist of the material remaining after completion of **KT-03**. To provide the quantities designated in **Section 4.3** and **Section 4.4** of this test method, it may be necessary to combine material from more than one test by **KT-03**.

**4.2.** The aggregate shall be dried to substantially constant mass at a temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**4.3.** Test samples of fine aggregate shall consist of the particles coarser than a No. 16 (1.18 mm) sieve and shall weigh not less than 100 g.

**4.4.** Test samples of coarse aggregate shall be separated into different sizes using the following sieves: No. 16 (1.18 mm), No. 4 (4.75 mm), 3/8 in (9.5 mm), 3/4 in (19.0 mm), and 1 1/2 in (37.5 mm). The test samples shall have a mass not less than indicated in **Table 1**:

**Table 1**  
**Sample Sizes for Coarse aggregate**  
**When testing for Clay Lumps and Friable Particles**

Sizes of Particles Making Up Test Sample	Minimum Mass of Test Sample, g
No. 4 to 3/8 in (4.75 to 9.5 mm)	1,000
3/8 to 3/4 in (9.5 to 19.0 mm)	2,000
3/4 to 1 1/2 in (19.0 to 37.5 mm)	3,000
Over 1 1/2 in (37.5 mm)	5,000

**4.5.** If the grading of the original sample provides less than 5% of any of the sizes indicated in **Section 4.4** of this test method, do not test that size.

**4.6.** In the case of aggregate which is composed of substantial amounts of both fine and coarse aggregate sizes, the material shall be separated into two sizes at the No. 4 (4.75 mm) sieve, and the samples of fine and coarse aggregate shall be prepared in accordance with **Section 4.3** and **Section 4.4** of this test method. Any aggregate containing 50% or more material retained on the No. 4 (4.75 mm) sieve is considered to be coarse aggregate.

**NOTE:** In most cases, only the plus No. 4 (4.75 mm) fraction of coarse aggregate needs to be evaluated by this test method regardless of the amount of minus No. 4 (4.75 mm) material present. However, the amount of No. 16 (1.18 mm) to No. 4 (4.75 mm) material present shall be included in the mass of the test sample in **Section 6** of this test method, when calculating the percent of clay lumps and friable particles.

## **5. TEST PROCEDURE**

**5.1.** Weigh the test sample and spread it in a thin layer on the bottom of the container, cover it with water and allow it to soak for a period of  $24 \pm 4$  hours. Roll and squeeze particles individually between the thumb and forefinger to attempt to break the particle into smaller sizes. Do not use fingernails to break up particles or press particles against a hard surface or each other. Any particles that can be broken with the fingers into fines removable by wet sieving shall be classified as clay lumps and friable particles. After all discernible clay lumps and friable particles have been broken; separate the undersized material from the remainder of the sample by wet sieving over the sieve prescribed in **Table 2**.

Perform the wet sieving by passing water over the sample through the sieve while manually agitating the sieve, until all undersize materials has been removed.

**5.2.** Remove the retained particles carefully from the sieve, dry to substantially constant mass at a temperature  $230 \pm 9^\circ\text{F}$  ( $110 \pm 5^\circ\text{C}$ ), allow to cool, and weigh to the accuracy specified for the balance in **Part V, 5.9; Sampling and Test Methods Foreword**.

**Table 2**  
**Size of Sieve for Removing**  
**Residue of Clay Lumps and Friable Particles**

Sizes of Particles Making Up Test Sample	Sieve Size for Removing Clay Lumps and Friable Particles
Fine Aggregate [retained on No. 16 (1.18 mm)]	No. 20 (850 µm)
No. 4 to 3/8 in (4.75 to 9.5 mm)	No. 8 (2.36 mm)
3/8 to 3/4 in (9.5 to 19.0 mm)	No. 4 (4.75 mm)
3/4 to 1 1/2 in (19.0 to 37.5 mm)	No. 4 (4.75 mm)
Over 1 1/2 in (37.5 mm)	No. 4 (4.75 mm)

## 6. CALCULATIONS

**6.1** Compute the percentage of clay lumps and friable particles by the following formula:

$$P = \frac{100 (W-R)}{W}$$

Where: P = percent of clay lump and friable particles  
W = mass of test sample (for fine aggregate the mass of the portion coarser than the No. 16 (1.18 mm) sieve as described in **Section 4.3** of this test method), and  
R = mass of particles retained on designated sieve, as determined in accordance to **Section 5.2** of this test method.

**6.2.** For coarse aggregate, the percent of clay lumps and friable particles shall be an average based on the percent of clay lumps and friable particles in each sieve size fraction weighted in accordance with the grading of the original sample before separation or, preferably, the average grading of the supply represented by the sample. For the purpose of calculating the weighted average when the sample contains less than 5% of the material in a given size, that size shall be considered to contain the same percent of clay lumps and friable particles as the next larger or next smaller size, or use the average of the next smaller and larger sizes, if both are present.

## 7. REPORT

**7.1.** Record the mass of clay lumps and friable particles in aggregate to the nearest 0.1 g or 0.01% of the sample mass. Record the calculated percentages of clay lumps and friable particles in aggregate to the nearest 0.01%. Report the clay lumps and friable particles in aggregate to the nearest 0.1%.

## 5.9.08 SHALE OR “SHALELIKE” MATERIALS IN AGGREGATE (Kansas Test Method KT-08)

### **1. SCOPE**

This test method shall be used to determine the percentage of shale, mudstone, clay stone or other materials which would exhibit the properties of shale upon weathering.

### **2. REFERENCED DOCUMENTS**

**2.1.** Part V, 5.9; Sampling and Test Methods Foreword

**2.2.** ASTM E11; Woven Wire Test Sieve Cloth and Test Sieves

### **3. APPARATUS**

**3.1.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

**3.2.** Oven capable of maintaining uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**3.3.** Standard 3/8 in (9.5 mm) sieve conforming to **ASTM E11**.

**3.4.** Drying pans

### **4. SAMPLE PREPARATION**

**4.1.** A sample having a minimum mass of 10,000 g shall be used for this test. The sample shall first be dried to a constant mass at a uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ). After the sample has cooled so that it may be readily handled, it shall be weighed to the nearest 1.0 g and the mass recorded. The sample shall then be screened over a 3/8 in (9.5 mm) sieve and the material passing the 3/8 in (9.5 mm) sieve shall be discarded. The material retained on the 3/8 in (9.5 mm) sieve shall be moistened sufficiently to facilitate identification of the deleterious material. Moistening of the material shall be within the range of lightly spraying to completely immersing for a ten minute period. The amount of moistening shall be that amount which will best assist in identifying the deleterious material but will not result in disintegration and subsequent loss of the material.

### **5. TEST PROCEDURE**

**5.1.** While the sample is still moist, it shall be examined carefully and all pieces of shale or shalelike material shall be removed for weighing. The shale and shalelike material may be identified by any of the following:

**5.2.** A soapy, slick surface when wet.

**5.3.** Laminations or bedding planes along which it will split with comparative ease.

**NOTE:** Mineralized or organic seams can be common in specimens but should not be mistaken for or considered as laminations unless they are coincident with individual laminations or bedding planes.

**5.4.** Mudstone appearing particles in which very crude and indistinct laminations can be observed but will not easily separate along the laminations.

**5.5.** Mudstone appearing particles in which no laminations appear but which are composed of finely divided mineral matter of clay grade and composition.

**5.6.** The shale or shale-like material removed from the sample shall be dried to a constant mass at a uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ). After the shale/ shale-like material has cooled so that it may be readily handled, it shall be weighed to the nearest 1.0 g and the mass recorded.

## 6. CALCULATIONS

**6.1.** Compute the percentage of shale by the following formula:

$$\text{Percent Shale} = \frac{100 (\text{Mass of Dry Shale Retained})}{\text{Original Dry Mass of Test Sample}}$$

**NOTE:** As an alternative to drying the whole sample, a representative sample of 2,500 g minimum for moisture may be split out of the whole sample. The moist sample is dried to constant mass at a uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ). The percentage of moisture is calculated to two places to the right of the decimal point and is used to correct the mass of the remainder of the sample to dry mass. This dry mass of the remainder of the sample is used as the Original Dry Mass of Test Sample (10,000 g minimum in **section 4.1** of this test method).

Example:

Wet mass of moisture sample	= 2,645 g
Dry mass of moisture sample	= 2,557 g
Wet mass of the remainder of sample	= 10,976 g

Percentage of Moisture =

$$\frac{100(\text{Wet mass of sample} - \text{Dry mass of sample})}{\text{Dry mass of sample}}$$

$$\frac{100 (2,645 - 2,557)}{2,557} = 3.44\%$$

Dry mass of the remainder of the sample =

$$\frac{100(\text{Wet mass of the remainder of the sample})}{(100 + \text{Percentage of Moisture})}$$

$$\frac{100(10,976)}{100 + 3.44} = \frac{100(10,976)}{103.44} = 10,611 \text{ g}$$

## 5.9.10 PLASTICITY TESTS (Kansas Test Method KT-10)

### 1. SCOPE

This method of test covers the procedures for determining the liquid limit, plastic limit and plastic index of soils and the minus No. 40 (425  $\mu$ m) portions of aggregates. For aggregates, use the wet preparation method described in **Section 9** of this test method. **KT-10** reflects testing procedures found in **AASHTO R-58, T 89** and **T 90**.

### 2. REFERENCED DOCUMENTS

**2.1.** Part V, 5.9; Sampling and Test Methods Foreword

**2.2** KT-11; Moisture Tests

**2.3.** ASTM E11; Woven Wire Test Sieve Cloth and Test Sieves

**2.4.** AASHTO T 89; Determining the Liquid Limit of Soils

**2.5.** AASHTO T 90; Determining the Plastic Limit and Plasticity Index of Soils

### 3. APPARATUS

**3.1.** The balance shall conform to the requirements of **Part V, Section 5.9; Sampling and Test Methods Foreword** for the class of general purpose required for the principal sample mass of the sample being tested.

**3.2.** A suitable device capable of drying samples at a temperature not exceeding 140°F (60°C), for the preparation of the samples.

**3.3.** Oven thermostatically controlled capable of maintain a uniform temperature of  $230 \pm 9^\circ\text{F}$  ( $110 \pm 5^\circ\text{C}$ ), for drying of moisture samples.

**3.4.** A porcelain-evaporating dish, preferably unglazed about 4.5 in (115 mm) in diameter.

**3.5.** Spatula having a blade about 0.75 in (20 mm) wide and 3 in (75 mm) long.

**3.6.** A mechanically operated Liquid Limit Device consisting of a brass cup and carriage meeting the requirements of **AASHTO T 89, Figure 1** and **Sections 4.3.1 and 4.3.2** of this test method.

**3.7.** A manually operated device constructed in accordance with **AASHTO T 89, Section 3.3.1**.

**3.8.** Curved grooving tool meeting the requirements of **AASHTO T 89, Figure 1**.

**3.9.** A gage whether attached to the grooving tool or separate, conforming to the critical dimension “d” shown in **AASHTO T 89 Figure 1** and may be, if separate, a metal bar  $0.394 \pm 0.008$  in. ( $10.0 \pm 0.2$  mm) thick and approximately 2 in (50 mm) long.

**NOTE:** All Liquid Limit Devices and curved grooving tools should be examined for conformance with the requirements of **AASHTO T 89** before they are used.

**3.10.** Suitable containers made of material resistant to corrosion and not subject to change in mass or disintegration on repeated heating and cooling. Containers shall have close-fitting lids to prevent loss of moisture from samples before initial mass determination and to prevent absorption of moisture from the atmosphere following drying and before final mass determination. One container is needed for each moisture content determination.

**3.11.** Pulverizing apparatus: Either a mortar and rubber-covered pestle or a mechanical device consisting of a power driven rubber-covered muller suitable for breaking up the aggregation of soil particles without reducing the size of the individual grains.

**NOTE:** Other types of apparatus, such as a revolving drum into which the soil sample and rubber-covered rollers are placed and tumbled until soil aggregations are pulverized, are satisfactory if the aggregations of soil particles are broken up without reducing the size of the individual grains.

**3.12.** Series of sieves including No. 4 (4.75 mm), No. 10 (2.00 mm), and No. 40 (425  $\mu$ m) conforming to **ASTM E11**.

**3.13.** Standard KDOT 16 by 10 by 5.5 in (400 by 250 by 140 mm) wash pan equipped with No. 40 (425  $\mu$ m) screen (optional).

**3.14.** Ground glass plate. The finish on the ground glass plate is obtained using a medium to fine grade of abrasive dust. An emery dust essentially passing the No. 60 (250  $\mu$ m) sieve and retained on the No. 100 (150  $\mu$ m) sieve has been found to be satisfactory.

A small amount of water is sprinkled on a glass plate along with the abrasive dust. Another plate is laid on top and the plates are rubbed together until a uniform frosty finish is obtained.

**3.15.** Plastic Limit Device such as a Gilson SA-18. (See **Figure 2**) This is used for the alternate procedure using the Plastic Limit Device, see **Section 6.4** of this test method.

#### **4. LIQUID LIMIT TEST<sup>1</sup>**

**4.1.** Definition: The liquid limit of a material is the water content, when determined in accordance with this test method, at which the material passes from a plastic to a liquid state. This corresponds to a theoretical moisture content at which the material will flow in such a manner as to produce a 0.5 in (13 mm) closure of a groove when jarred by 25 drops of the cup on the Liquid Limit Device.

**4.2.** Preparation of Sample: Dry the material at a temperature not exceeding 140°F (60°C). See **Section 9**, aggregate material preparation.

**4.2.1.** The dried sample shall be separated into two fractions using a No. 10 (2.00 mm) sieve. The fraction retained on the sieve shall be ground with the pulverizing apparatus until the aggregations of soil particles are broken into separate grains. The ground soil shall then be separated into two fractions using the No. 10 (2.00 mm) sieve. Discarding the material retained on the sieve.

**4.2.2.** Dry-screen the material over a No. 40 (425  $\mu$ m) sieve to remove as much of the portion passing the No. 40 (425  $\mu$ m) sieve as possible.

---

<sup>1</sup> **AASHTO T 89 and ASTM D4318** allow for both method “A” and method “B”. **KT-10** allows for method “A” only.

**4.2.3.** The fraction retained on the No. 40 (425  $\mu\text{m}$ ) sieve shall be ground with the pulverizing apparatus in such a manner as to break up the aggregations without fracturing the individual grains. If the sample contains brittle particles, such as flakes of mica, fragments of seashells, etc., the pulverizing operation shall be done carefully and with just enough pressure to free the finer material that adheres to the coarser particles. The ground soil shall then be separated into two fractions by means of the No. 40 (425  $\mu\text{m}$ ) sieve and the material shall be reground as before. When the repeated grinding produces only a small quantity of soil passing the No. 40 (425  $\mu\text{m}$ ) sieve, the material retained on the No. 40 (425  $\mu\text{m}$ ) sieve shall be discarded. The several fractions passing the No. 40 (425  $\mu\text{m}$ ) sieve obtained from the grinding and sieving operations just described shall be thoroughly mixed together and set aside for use in performing the physical tests.

### **4.3. Test Procedure**

**4.3.1.** Adjust the height of drop of the brass cup on the Liquid Limit Device by means of the adjustment plate. The height to which the cup is lifted by the cam is adjusted so that the point on the cup which comes in contact with the base is  $0.394 \pm 0.008$  in ( $10.0 \pm 0.2$  mm) above the base. Secure the adjustment plate by tightening the appropriate screws.

Place a piece of masking tape across the outside bottom of the cup parallel with the axis of the cup hanger pivot (**See Figure 3**). Place the tape between the wear spot and the pivot so that the edge of the tape away from the cup hanger bisects the spot on the cup that contacts the base. Slide the height gauge under the cup to the device and turn the crank until the cup is raised to its maximum height.

The adjustment is checked with the gauge in place by revolving the crank several times. If the adjustment is correct, a slight ringing sound will be heard when the cam strikes the cam follower. If the cup is raised off the gauge or no sound is heard, further adjustment is made.

Remove the tape after adjustment.

**4.3.2.** Inspect the Liquid Limit Device to be sure that it is in good working order and that there are no worn or “out of alignment” parts that will affect the test results.

**4.3.3.** Take a sample weighing approximately 100 g and place in the mixing dish. The sample shall be thoroughly mixed with 15 to 20 mL of distilled or demineralized water by alternately and repeatedly stirring, kneading and chopping with a spatula. Further additions of water shall be made in 1 to 3 mL increments. Each increment of water shall be thoroughly mixed with the soil, as previously described, before another increment of water is added. Once testing has begun, no additional dry soil should be added to the moistened soil. The cup of the Liquid Limit Device shall not be used for mixing soil and water. If too much moisture has been added to the sample, the sample shall either be discarded, or mixed and kneaded until the natural evaporation lowers the closure point into acceptable range.

**NOTE:** Some soils are slow to absorb water; therefore, it is possible to add increments of water so fast that a false liquid limit value is obtained. This can be avoided if more mixing and/or time is allowed. Tap water may be used for routine testing if comparative tests indicate no differences in results between using tap water and distilled or demineralized water. However, referee, or disputed tests shall be performed using distilled or demineralized water.

**4.3.4.** When sufficient water has been thoroughly mixed with the soil to form a uniform mass of stiff consistency, a sufficient quantity of this mixture shall be placed in the cup above the spot where the cup rests on the base and shall be squeezed and spread with the spatula to level and at the same time trimmed to a depth of 10 mm at the point of maximum thickness. As few strokes of the spatula as possible shall be

used, care being taken to prevent the entrapment of air bubbles within the mass. The excess soil shall be returned to the mixing dish. The soil in the cup of the device shall be divided by a firm stroke of the grooving tool along the diameter through the centerline of the cam follower so that a clean sharp groove of proper dimensions will be formed. To avoid tearing the sides of the groove or slipping of the soil cake on the cup, up to six strokes from front to back or from back to front counting as one stroke shall be permitted. The depth of the groove should be increased with each stroke and only the last stroke should scrape the bottom of the cup.

**4.3.5.** The cup containing the sample prepared as described in **Section 4.3.4** of this test method, shall be lifted and dropped by turning the crank at the rate of approximately two revolutions per second until the two sides of the sample come in contact at the bottom of the groove along a distance of about 0.5 in (13 mm). The number of shocks required to close the groove this distance shall be recorded. The base of the machine shall not be held with the free hand while the crank is turned.

**NOTE:** Some soils tend to slide on the surface of the cup instead of flowing. If this occurs, more water should be added to the sample and remixed, then the soil-water mixture placed in the cup, a groove cut with grooving tool and **Section 4.3.5** repeated. If the soil continues to slide on the cup at a lesser number of blows than 25, the test is not applicable and a note should be made that the liquid limit could not be determined.

**4.3.6.** A slice of soil approximately the width of the spatula, extending from the edge to edge of the soil cake at right angles to the groove and including that portion of the groove in which the soil flowed together, shall be removed and placed in suitable container. Record the sample mass to the nearest 0.01 g. The soil in the container shall be dried in accordance with **KT-11** to determine the moisture content. The use of a lid for the container as stated in **KT-11** is required. Record the results.

**4.3.7.** The soil remaining in the cup shall be transferred to the mixing dish. The cup and grooving tool shall be washed and dried in preparation for the next trial.

**4.3.8.** The foregoing operations shall be repeated for at least two additional portions of the sample to which sufficient water has been added to bring the soil to a more fluid condition. The object of this procedure is to obtain samples of such consistency that at least one determination will be made in each of the following ranges of shocks: 25-35, 20-30, 15-25. The range of the three determinations shall be at least 10 shocks.

## 5. CALCULATIONS

**5.1.** Calculate the moisture content of the sample as follows:

$$\text{Moisture Content} = \frac{100 \times (A-C)}{(C-B)}$$

Where:      A= Mass of wet soil and container, g  
                  B= Mass of container, g  
                  C= Mass of dry soil and container, g

**5.1.1.** Record the moisture content to the nearest 0.1%.

**5.2.** A “Flow Curve” representing relation between moisture content and corresponding number of shocks shall be plotted on a semi-logarithmic graph with the moisture contents as abscissa on the arithmetical

scale, and the number of shocks as ordinates on the logarithmic scale. The flow curve shall be a straight line drawn as nearly as possible through the three plotted points. (Figure 1)

**Figure 1**  
**Flow Curve Chart**  
**(KDOT Form No. 664)**

**5.3.** The moisture content corresponding to the intersection of the flow curve with the 25 shock ordinate shall be taken as the liquid limit of the soil. Report this value to the nearest whole number.

## **6. PLASTIC LIMIT TEST**

**6.1. Definition:** The plastic limit of a material is the lowest water content, when determined in accordance with this test method, at which the material remains plastic.

**6.2. Preparation of Sample:** The test is conducted using material finer than the No. 40 ( 425  $\mu$ m) sieve. The minus No. 40 ( 425  $\mu$ m) material is prepared as outlined in **Section 4.2** of this test method.

### **6.3. Test Procedure**

**6.3.1.** Thoroughly mix the minus No. 40 ( 425  $\mu$ m) material and place approximately 20 g in an evaporation dish.

**6.3.2.** Thoroughly mix with distilled or demineralized water until the mass becomes plastic enough to be easily shaped into a ball. Take a portion of this ball with a mass of about 10 g for the test sample.

**NOTE:** Tap water may be used for routine testing if comparative tests indicate no differences between using tap water and distilled or demineralized water. However, referee or disputed tests shall be performed using distilled or demineralized water.

**6.3.3.** If both the liquid and plastic limits are required, take a test sample with a mass of about 10 g from the thoroughly wet and mixed portion of the soil prepared in accordance with **Section 4.3.3** of this test method. Take the sample at any stage of the mixing process at which the mass becomes plastic enough to be easily shaped into a ball without sticking to the fingers excessively when squeezed. If the sample is taken before completion of the liquid limit test, set it aside and allow it to season in air until the liquid limit test has been completed. If the sample taken during the liquid limit test is too dry to permit rolling to a 1/8 in (3.0 mm) thread, add more water and remix.

**6.3.4.** Select 1.5 to 2.0 g of soil taken in **Section 6.3.3** of this test method. Form into an ellipsoidal mass.

**6.3.5.** Roll this mass between the fingers and the palm of the hand and a ground glass plate with just sufficient pressure to roll the mass into a thread of uniform diameter throughout its length. The rate of rolling shall be between 80 and 90 strokes per minute, counting a stroke as one complete motion of the hand forward and back to the starting position again. Reduce the diameter of the thread to 1/8 in (3.0 mm), taking no more than 2 min. Quickly squeeze and reform the thread into an ellipsoidal shaped mass and re-roll. Continue this alternate reforming and re-rolling to a thread 1/8 in (3.0 mm) in diameter, gathering together, kneading and re-rolling, until the thread crumbles under the pressure required for rolling and the material can no longer be rolled into a thread. The crumbling may occur when the thread is greater than 1/8 in (3.0 mm) in diameter. This shall be considered a satisfactory end point, provided the material has been rolled to a thread of 1/8 in (3.0 mm) during the previous rolling. The crumbling will manifest itself differently with various types of material. Some materials fall apart in numerous small aggregations of particles; others may form an outside tubular layer that starts splitting at both ends. Splitting progresses toward the middle, and finally, the thread falls apart in many small platy particles. It is not practical to define crumbling to an exact degree since, as stated above, crumbling will manifest itself differently for different materials. At no time shall the operator attempt to produce failure at exactly 1/8 in (3.0 mm) diameter by allowing the thread to reach 1/8 in (3.0 mm), then reducing the rate of rolling or the hand pressure or both, and continuing the rolling without further deformation until the thread falls apart. It is permissible, however, to reduce the total amount of deformation for feebly plastic soils by making the initial diameter of the ellipsoidal shaped mass nearer to the required 1/8 in (3.0 mm) final diameter.

**6.3.6.** Place the crumbled thread in a watch glass or other suitable container of known mass and close to prevent evaporation loss. Repeat steps 6.3.4. to 6.3.6. until the entire 10 gram sample has been tested.

**6.3.7.** Gather the portions of the crumbled soil together and place in a suitable tared container. Record the sample mass to the nearest 0.01 g. The soil in the container shall be dried in accordance with **KT-11 Sections 3 through 5**, to determine the moisture content. The use of a lid for the container as stated in KT-11 is required. Record the results.

#### **6.4. Alternate procedure using the Plastic Limit Device**

**6.4.1.** Attach smooth unglazed paper to both the bottom fixed plate and the top of the Plastic Limit Device.

**6.4.2.** Split the 10 g. test sample taken in **Section 6.3.3 and 6.3.4** of this test method into four or five masses of 1.5 to 2.0 g each. Squeeze into an ellipsoidal-shape and place two to three masses on the bottom plate. Place the top plate in contact with the soil masses. Simultaneously with a slight downward force, apply a back-and-forth rolling motion with the top plate until the top plate comes into contact with the 3.2 mm side rails, within two minutes. Do not allow the soil thread to come into contact with the side rails.

**6.4.3.** Continue the test as outlined in **Sections 6.3.5, 6.3.6, and 6.3.7** of this test method.

### **7. CALCULATIONS**

**7.1.** Calculate the moisture content of the sample at its plastic limit as follows:

$$\text{Plastic Limit} = \frac{100 \times (A - C)}{(C - B)}$$

Where:        A= Mass of wet soil and container, g  
                   B= Mass of container, g  
                   C= Mass of dry soil and container, g

**7.2.** Record all masses to the nearest 0.01 g. Calculate and record the percentage of moisture to the 0.1%, report the percentage of moisture to the nearest whole percent.

## **8. PLASTIC INDEX**

**8.1.** Definition: The plastic index of a material is the numerical difference between the liquid limit and the plastic limit.

**8.2.** Calculations: Calculate the plastic index as follows, or calculate on **KDOT Form 663**.

Plastic Index = Liquid Limit (as recorded) – Plastic Limit (as recorded).

**8.3.** Reporting: Report the plastic index and liquid limit (when required) to the nearest whole number.

**NOTE:** When testing extremely sandy samples, it is permissible to conduct the plastic limit test first. If the plastic limit cannot be determined, report the plastic index as NP (i.e. nonplastic). If the plastic limit is equal to or greater than the liquid limit, report the plastic index as NP.

## **9. WET PREPARATION (FOR AGGREGATE MATERIAL ONLY)**

**9.1.** The following “wash” method of preparation shall be used for all types of aggregates, binder soil and mineral fillers. However, in the case of a mineral filler which all passes a No. 40 (425 µm) sieve, the washing process may be waived and the sample prepared for testing by reducing it to particle size using the pulverizing apparatus.

**9.2.1.** Dry the material to a moisture condition at which it can be pulverized and dry-screened without sticking or clogging the screens.

**9.2.2.** Dry-screen the material over a No. 40 (425 µm) sieve to remove as much of the portion passing the No. 40 (425 µm) sieve as possible before washing. Several larger sieves may be used in this process to keep part of the load off the No. 40 (425 µm) sieve. This initial dry-screening is very important as it helps to reduce the time and water required for the washing process which follows. Set aside the minus No. 40 (425 µm) material obtained in this manner for recombination with material obtained by later steps.

**9.2.3.** Place the material retained on the No. 40 (425 µm) sieve in a pan, cover with water and soak for a minimum of 30 minutes.

**9.2.4.** Following the soaking period, wash the material, using not less than four applications of wash water, including the soaking water. Each application of water must cover the entire sample. The washing for each application is accomplished by a “sloshing” action of the pan. Should an appreciable amount of plastic material remain with the sample after four applications of water, use additional applications accompanied by more vigorous agitation of the material. Decant each application of the wash water through a No. 40 (425 µm) sieve, saving all of the wash water and material.

**9.2.5.** Evaporate the water from the washed plus No. 40 (425  $\mu\text{m}$ ) material and from the material washed through the No. 40 (425  $\mu\text{m}$ ) sieve using an oven with temperature settings not to exceed 140°F (60°C). In most cases, after a short period of heating, the particles in suspension will settle out so that the clear water at the top of the pan may be siphoned off to reduce the drying time.

**9.2.6.** If the material in the retained wash water becomes caked during the drying process, break it down to pass the No. 40 (425  $\mu\text{m}$ ) sieve with the pulverizing apparatus. This pulverizing shall be done, insofar as possible, in a manner which will not change the characteristics of the material.

**9.2.7.** Dry-screen the dried material, retained on the No. 40 (425  $\mu\text{m}$ ) sieve during the washing process, over a No. 40 (425  $\mu\text{m}$ ) sieve after which the material retained on the sieve may be discarded.

**9.2.8.** Recombine and thoroughly mix the minus No. 40 (425  $\mu\text{m}$ ) material obtained by the initial dry-screening, that obtained by washing and that obtained by re-screening the coarse material after washing. The sample thus prepared is ready for testing.

**Brass Cup Calibration**

5.9.14 (5.16.14) MARSHALL TESTS OF BITUMINOUS MIXES  
(Kansas Test Method KT-14)

**a. SCOPE**

This method of test covers the procedures for testing bituminous mixes to determine:

**a.1.** Optimum Asphalt Content.

**a.2.** Density Characteristics, including voids content.

**a.3.** Stability Characteristics, including resistance to plastic flow and flow properties.

**a.4.** This method is limited to mixes containing asphalt cement and containing aggregate having a maximum size of 25 mm (1 in). KT-14 reflects testing procedures found in AASHTO T 245 and T 269.

**b. REFERENCED DOCUMENTS**

**b.1.** KT-15; Bulk Specific Gravity and Unit Weight of Compacted Bituminous Mixtures

**b.2.** KT-57; Determination of Asphalt Content and Gradation of Hot Mix Asphalt Concrete by the Ignition Method

**b.3.** KT-58; Method for Preparing and Determining the Density of Hot Mix Asphalt (HMA) Specimens by Means of the Superpave Gyratory Compactor

**b.4.** AASHTO M 231; Balances Used in Testing of Materials

**b.5.** AASHTO T 245; Resistance to Plastic Flow of Bituminous Mixtures Using Marshall Apparatus

**b.6.** AASHTO T 269; Percent Air Voids in Compacted Dense and Open Bituminous Paving Mixtures

## **c. APPARATUS**

**c.1. Specimen Mold Assembly:** A cylindrical mold having an inside diameter of  $101.6 \pm 0.25$  mm ( $4.000 \pm 0.010$  in)<sup>1</sup> and a length of approximately 90 mm ( $3 \frac{7}{16}$  in). The mold is open at each end and is equipped with a removable collar and a base plate about 15 mm ( $\frac{9}{16}$  in) in thickness. A minimum of three molds is recommended.

**c.2. Compaction Hammer:** The compaction hammer consists of a hammer having a flat circular tamping face, 98.4 mm ( $3 \frac{7}{8}$  in) in diameter, and appropriate extension rod with handle which acts as guide for a free falling weight. The weight shall weigh  $4,536 \pm 18$  g ( $10 \pm 0.04$  lb) and have a free fall of  $457.2 \pm 2.5$  mm ( $18 \pm 0.1$  in). The hammer may be operated manually or be driven with a motor. Two compaction hammers are recommended.

**c.3. Compaction Pedestal:** The compaction pedestal is a wood block approximately 300 by 300 by 450 mm (12 by 12 by 18 in). A 300 by 300 by 25 mm (12 by 12 by 1 in) steel plate is securely fastened to the top of the block. The pedestal is set on and securely fastened to a solid concrete slab with the vertical axis plumb and the top level.

**c.4. Specimen Mold Holder:** The specimen mold holder has a semi-circular base and a flanged top to hold the specimen mold in place during the compaction process. Any equivalent hold down device which performs the same function is satisfactory.

**c.5. Specimen Extruder:** An extruder for the removal of the specimens from the mold is recommended. The unit may consist of a steel frame to hold the mold, a hydraulic jack and a steel disc approximately 13 mm ( $\frac{1}{2}$  in) thick and 100 mm (3.9 in) in diameter.

**c.6. Testing Assembly:** This includes a breaking head, a load measuring device and two flow meters, dial micrometers or an automatic stability/flow recording device. The testing assembly shall be calibrated at intervals not exceeding two years.

**c.6.a. Breaking Head:** The breaking head consists of two accurately machined cylindrical segments having an inside radius of 50 mm (2 in). The lower segment is mounted on a base having two perpendicular guide rods or posts extending upward. Sleeves in the upper segment are positioned to guide

---

<sup>1</sup> AASHTO T 245 requires the specimens to be  $101.6 \pm 0.1$  mm ( $4.000 \pm 0.05$  in).

the two segments together without appreciable binding or loose motion on the guide rods.

**c.6.b.** Flow Meters: Two flow meters graduated in 0.25 mm (0.01 in) increments and conforming to the details set forth in AASHTO T 245 or two micrometer dials graduated in 0.025 mm (0.001 in) increments are used to measure plastic flow. Instead of the flowmeter, a micrometer dial or stress-strain recorder graduated in 0.25 mm (0.01 in) divisions.

**c.6.c.** Loading Device: The loading device may be either a screw jack or a hydraulic system, manually or motor operated to produce a constant vertical movement of  $50 \pm 2$  mm/min ( $2 \pm 0.1$  in/min) during application of load.

**c.6.d.** Load Measuring Device:

**c.6.d.1.** Proving ring assembly consisting of a 20 kN (5,000 lb) capacity proving ring, sensitive to 44.5 N (10 lb) up to 4.45 kN (1,000 lb) and to 111.2 N (25 lb) above 4.45 kN (1,000 lb). The proving ring is equipped with a micrometer dial graduated in 0.0025 mm (0.0001 in) increments.

The upper portion of the ring is attached to the testing frame and the lower portion transmits the load to the breaking head.

**c.6.d.2.** In lieu of the proving ring assembly, any suitable load measuring device may be used providing the capacity and sensitivity meet the above requirements.

**c.7.** Heating Equipment: Ovens or hot plates for heating aggregates, bituminous material, specimen molds, compaction hammers and other associated items required for mixing and molding. It is recommended that, when possible all heating units be thermostatically controlled to maintain the required temperature within  $\pm 2.8^{\circ}\text{C}$  ( $\pm 5^{\circ}\text{F}$ ). Suitable shields, thick steel plates or pans of sand shall be used on the surfaces of hot plates to minimize localized overheating.

**c.8.** Mixing Apparatus: Mechanical mixing is recommended. Any type of mechanical mixer may be used provided it will produce a well coated, homogeneous mixture of the required amount in the allowable time and further that the mixing paddle or whip does not fracture or pulverize aggregate fractions during the mixing process. The bowl employed with the mixer shall be of such a nature that essentially all of the batch can be removed. More than one mixing bowl is recommended unless the mixer is equipped

with a heating jacket to keep the bowl heated during the mixing process.

**c.9.** Water Bath: The water bath shall be approximately 140 mm (5 1/2 in) deep and shall be thermostatically controlled so as to maintain the bath at  $60 \pm 1^{\circ}\text{C}$  ( $140 \pm 2^{\circ}\text{F}$ ). The tank shall have a perforated false bottom or be equipped with a shelf for adequately supporting specimens approximately 50 mm (2 in) above the bottom of the bath.

**c.10.** Miscellaneous Equipment:

**c.10.a.** Containers for heating aggregates, flat-bottom metal pans or other suitable containers.

**c.10.b.** Containers for heating bituminous material, beakers, ointment cans, pouring pots, etc. may be used.

**c.10.c.** Mixing tool, steel towel or spatula, for spading and hand mixing.

**c.10.d.** Thermometers for determining temperatures of aggregate, bitumen and bituminous mixtures. Armored glass or dial type with metal stem thermometers may be used. A range of at least 10 to  $200^{\circ}\text{C}$  ( $50$  to  $400^{\circ}\text{F}$ ) with a sensitivity of  $2.8^{\circ}\text{C}$  ( $5^{\circ}\text{F}$ ) is required.

**c.10.e.** Thermometer for water bath sensitivity to  $0.1^{\circ}\text{C}$  ( $0.2^{\circ}\text{F}$ ).

**c.10.f.** The balance shall conform to the requirements of AASHTO M 231 for the class of general purpose balance required for the principal sample mass of the sample being tested.

**c.10.g.** Large Spoon, for cleaning of mixing bowl or placing mixture in mold cylinders.

**c.10.h.** Specimen height measuring device.

**c.10.i.** Gloves for handling hot equipment.

**c.10.j.** 100 mm (4 in) dia. paper discs.

#### **d. DETERMINATION OF MIXING AND COMPACTING TEMPERATURE**

**d.1.** The temperatures to which the asphalt cement must be heated to produce a viscosity of  $170 \pm 20$  cSt ( $85 \pm 10$  SFS) shall be the mixing temperature.

**d.2.** The temperature to which the asphalt cement must be heated to produce a viscosity of  $280 \pm 30$  cSt ( $135 \pm 15$  SFS) shall be the compacting temperature.

#### **e. SAMPLE PREPARATION**

**e.1.** Hot Plant Mixes with Asphalt: Mix the sample of mixed material thoroughly and split out not less than three increments weighing approximately 1,200 g for a 100 mm (4 in) diameter plug. Bring the increments to within the limits of the compacting temperature determined in **d.2.** prior to compacting. See KT-57 **d.** for method of quartering to obtain proper sized sample.

**e.2.** Laboratory Prepared Mixes: *If using hydrated lime as an antistripping agent, then refer to the attached Addendum.*

**e.2.a.** Number of Specimens: It is recommended that each aggregate combination be tested at six different asphalt contents, in 1/2 percent increments. At least three specimens are prepared for each percentage of asphalt. Prepare one extra aggregate and asphalt sample to be mixed first and then thrown away. This sample is to "butter" the mixing bowl and paddle and thus reduce material loss when mixing the test specimens.

**e.2.b.** Preparation of Virgin Aggregates: Dry individual aggregates to constant mass at 105 to 110°C (221 to 230°F). Separate the individual aggregates by dry screening into desired fractions. The following size fractions are recommended as a minimum:

25.0 to 19.0 mm	(1 to 3/4 in)	4.75 to 2.36 mm	(No.4 to No.8)
19.0 to 12.5 mm	(3/4 to 1/2 in)	2.36 to 1.18 mm	(No.8 to No.16)
12.5 to 9.5 mm	(1/2 to 3/8 in)	Passing 1.18 mm	(Passing No.16)
9.5 to 4.75 mm	(3/8 in to No.4)		

**e.2.c.** Preparation of Reclaimed Material: Place the reclaimed material in a 50 to 80°C (125 to 175°F) draft oven for 1 1/2 to 2 hours, to soften. Transfer the materials to the mixing bowl and mix for two minutes in order to breakdown the reclaimed material to the recommended sizes. (Mixer will mix approximately 3,500 g.) Other methods of breakdown are acceptable provided they do not fracture aggregates or lose an

excessive amount of material in the process. Separate the reclaimed material into desired fractions by screening, when cool enough to screen. The following size fractions are recommended:

19.0 to 12.5 mm (3/4 to 1/2 in)	4.75 to 2.36 mm (No.4 to No.8)
12.5 to 9.5 mm (1/2 to 3/8 in)	Passing 2.36 mm (Passing No.8)
9.5 to 4.75 mm (3/8 in to No.4)	

Weigh each fraction and record percentage of total sample.

**e.2.d.** Preparation of Mixes: Combine the individual aggregates or reclaimed material and virgin aggregates by weighing out in a separate pan for each test specimen, proportionate amounts of each size fraction for each individual aggregate to produce the desired combined aggregate with a batch mass of approximately 1,125 g. This should be sufficient to produce a compacted specimen  $64 \pm 3$  mm ( $2.5 \pm 1/8$  in) thick<sup>2</sup>. Adjust the mass of the batch as needed to produce compacted specimens of  $64 \pm 3$  mm ( $2.5 \pm 1/8$  in) thickness.

Heat the aggregate and asphalt within the limits of mixing temperature determined in **d.1**. Charge the mixing bowl with the heated aggregate and form a crater in the top. Add the required amount of asphalt and mix the aggregate and asphalt until thoroughly coated, at least 2 minutes. Care should be taken to keep all of the sample in the mixing bowl during this process.

Place the mix in a 135°C (275°F) oven and age<sup>3</sup> the material for 2 hours as outlined in KT-58 **g.5**. At the end of the aging time place the mix in an oven set at the compaction temperature or reset the 135°C (275°F) oven temperature to reflect the compaction temperature. Allow the mix to adjust to the new temperature prior to removing for compaction.

**e.2.e.** Compaction of Specimens: Prior to the addition of the asphalt to the batches, thoroughly clean the specimen mold assembly and the face of the compaction hammer and heat the mold assembly and hammer in boiling water, in an oven or on a hot plate, to a temperature between 90 and 175°C (200 and 350°F). Assemble the mold, base plate and collar and place a paper disc cut to size in the bottom of the mold.

---

<sup>2</sup> AASHTO T 245 4.1. requires compaction height to be 25.4 mm (1.0 in.) to 76.2 mm (3.0 in.).

<sup>3</sup> The aging process reflects information found in the proposed AASHTO R 30 Standard Practice for Mixture Conditioning of Hot-Mix Asphalt (HMA).

Place the entire hot batch of aggregate-asphalt mixture in the mold, spade vigorously with a heated spatula or trowel 15 times around the perimeter and 10 times over the interior of the mold. Smooth the surface of the mix to a slightly rounded shape. The temperature of the mix just prior to compaction shall be within the limits determined in **d.2**. Place a paper disc on top of the mix.

Place the mold assembly, including the collar, on the pedestal, fasten securely with the mold holder and apply 50 or 75 blows<sup>a</sup> with the compaction hammer. Each blow must have the prescribed free fall of 457 mm (18 in) with the axis of the compaction hammer held perpendicular to the base of the mold assembly during the compaction process. Remove the base plate and collar, and reverse and reassemble the mold. Apply the specified number of blows to the reversed specimen. After compaction, remove the mold assembly from the pedestal. Place the mold into the extractor and pop the plug loose from the mold. Permit the plug to cool in this state until the next plug has been processed. Extrude the initial plug out of the mold and pop the next plug loose. Carefully transfer the extruded plug to a smooth, flat surface and allow it to stand until the plug reaches room temperature.

Note **a**: Traffic volume in the Design Lane determines the number of blows. (**See subsection 5.18.02 a.5.a. for traffic volume criteria.**)

**e.2.f.** Thickness of Specimen: Measure the specimen thickness to the nearest 0.025 mm (0.001 in). If the specimen thickness is less than 60 mm (2.375 in) or more than 67 mm (2.625 in), discard it and mold a replacement having a thickness within these limits.

**e.2.g.** Determination of Specific Gravity and Unit Weight: Determine the specific gravity and unit weight by the appropriate method as outlined in KT-15.

**e.2.h.** After determining the specific gravity for all of the specimens, proceed to **f**.

## f. TEST PROCEDURE

Immerse the specimens in a  $60 \pm 1^{\circ}\text{C}$  ( $140 \pm 2^{\circ}\text{F}$ ) water bath for 30 to 40 minutes<sup>4</sup>. Thoroughly clean the guide rods and inside surfaces of the test heads prior to making the test. Lubricate the guide rods so that the upper test head slides freely over them. Remove the specimen from the water bath and place in the breaking head. The elapsed time for the test from removal of the test specimen from the water bath to the maximum load determination shall not exceed 30 sec. Place the complete breaking head assembly in position on the testing machine. Place the flow meters, where used, in position over the guide rods and adjust the flow meters to zero. Hold the flow meters firmly against the upper segment of the breaking head while the test load is being applied. Avoid using excess pressure against the testing head while determining flow.

Apply the load to the specimen by a constant rate of movement of the load jack or testing machine head of 50 mm (2 in) per minute until a maximum load is reached and the load decreases as indicated by the proving ring dial. Record the maximum load noted on the testing machine or converted from the proving ring micrometer dial reading.

Release the flow meter sleeves or note the micrometer dial readings, where used, the instant the maximum load begins to decrease. Note and record the indicated flow values or equivalent units in 0.25 mm (0.01 in) if micrometer dials are used to measure flow.

For specimens other than 62.9 - 64.1 mm (2.476 - 2.525 in) in thickness, adjust the load using the proper correction factor from Table 5.16.14-1.

Table 5.16.14-1 Stability Correction Ratio

Thickness of Specimen in mm (in)	Correction Ratio
60.3 - 61.2 (2.375 - 2.410)	1.07
61.3 - 62.9 (2.411 - 2.475)	1.04
63.0 - 64.1 (2.476 - 2.525)	1.00
64.2 - 65.3 (2.526 - 2.570)	0.97
65.4 - 66.7 (2.571 - 2.625)	0.94

<sup>4</sup> AASHTO T 245 5.2. also permits placing the plug in an oven for 2 hours.

NOTE: The measured stability of a specimen multiplied by the ratio for the thickness of the specimen equals the corrected stability for a 63.5 mm (2 1/2 in) specimen.

**g. EVALUATION OF SPECIFIC GRAVITY AND STABILITY DATA:**

**g.1. Specific Gravity of Molded Specimens:**

**g.1.a.** If the difference between the specific gravity of a single specimen in a set of three specimens and the average of the set is greater than 0.025, discard the entire set and mold a new set.

**g.1.b.** If the difference between the specific gravity of a single specimen in a set of three specimens and the average of the set is greater than 0.014 and not greater than 0.025, discard the results of the single specimen and use the results of the tests on the remaining two specimens to compute the average specific gravity of the set.

**g.1.c.** If the difference between the specific gravity of a single specimen in a set of three specimens and the average specific gravity of the set in question is not greater than 0.014, the specific gravity of the specimen is acceptable and may be used to determine the average specific gravity.

**g.2. Stability of Molded Specimens:**

If the difference between the stability of a specimen and the average stability of the set of three specimens is not greater than the CV<sub>1</sub> values shown in Table 5.16.14-2 the specimen is acceptable for use in determining the average stability of the set.

If this difference is greater the CV<sub>1</sub> value but not greater than the CV<sub>2</sub> values, the specimen will be eliminated in the calculation of the average stability. Not less than two specimens will be used when determining the set average stability.

If the difference between the stability of any specimen of a set and the average stability of the set is greater than CV<sub>2</sub> values shown in Table 5.16.14-2, the entire set will be discarded and another set obtained.

Table 5.16.14-2 Stability Evaluation

Stability Range in N (lbf) (Based on Mean of Set)			CV <sub>1</sub>	CV <sub>2</sub>
0 - 2224	(0 - 500)	.....160	(35).....310	(70)
2228 - 4448	(501 - 1000)	.....290	(65).....580	(130)
4452 - 6672	(1001 - 1500)	.....440	(100).....890	(200)
6676 - 8896	(1501 - 2000)	.....580	(130).....1160	(260)
8900 - 11120	(2001 - 2500)	.....730	(165).....1470	(330)
11124 - 13344	(2501 - 3000)	.....870	(195).....1730	(390)
13348 - 15568	(3001 - 3500)	.....1000	(225).....2000	(450)
15572 - 17792	(3501 - 4000)	.....1160	(260).....2310	(520)
17796 - 20016	(4001 - 4500)	.....1290	(290).....2580	(580)
20020 - 22240	(4501 - 5000)	.....1420	(320).....2850	(640)

**h. REPORT (See section 5.10.04 (5.17.04) for methods of calculation)**

The report includes the following information for each combination of aggregates and each asphalt content:

**h.1.** Average density, kg/m<sup>3</sup> (lb/ft<sup>3</sup>) for each set of specimens.

**h.2.** Average maximum stability in N (lbf), corrected when required, for each set of specimens.

**h.3.** Average flow value, in 0.25 mm (hundredths of an inch), for each set of specimens.

**h.4.** Average mixing temperature, °C (°F), for each set of specimens.

**h.5.** Average compacting temperature, °C (°F), for each set of specimens.

**h.6.** Stability and flow test temperature, °C (°F).

**h.7.** Average % voids, total mix, for each set of specimens, (Pa) (See Section 5.10.4 (5.17.04)).

**h.8.** Average % of total voids filled with asphalt for each set of specimens (VFA).

**h.9.** Average % of voids in aggregate only (VMA).

**h.10.** Maximum percentage of asphalt allowed for high temperature protection (P'b).

**h.11.** Recommended asphalt percentage for initial plant operation.

**h.12.** Bearing Capacity.

**h.13.** Theoretical Maximum Specific Gravity.

Show values for **h.1.**, **h.2.**, **h.7.**, **h.8.**, **h.9.**, **h.12.**, and **h.13.** using KDOT Form 701.

**ADDENDUM TO KT-14**  
**FOR INCLUDING LIME AS AN ANTISTRIPPING AGENT**

The following information provides KT-14 with steps to incorporate hydrated lime as an antistripping agent.

**Delete e.2.d.** and replace with the following:

**e.2.d.** Preparation of Mixes: Combine the virgin aggregates by weighing in a separate pan for each test specimen, proportionate amounts of each size fraction for each individual aggregate to produce the desired combined aggregate with a batch mass of approximately 1,125 g. Include the hydrated lime mass required to meet the specified percent of lime for the project as part of the total batch mass. The total aggregate mass should include lime, virgin aggregate, and reclaimed material (if applicable). This should be sufficient to produce a compacted specimen  $64 \pm 3$  mm ( $2.5 \pm 1/8$  in) thick. Adjust the mass of the batch as needed to produce compacted specimens of  $64 \pm 3$  mm ( $2.5 \pm 1/8$  in) thickness.

**e.2.d.1.** Determine the SSD for the combined aggregate gradation. Add three percent of moisture to the percent moisture required to reach the SSD condition of the combined aggregate.

**e.2.d.2.** Place the combined virgin aggregate and hydrated lime in a mixing bowl. Carefully mix until the hydrated lime is combined with the aggregate. Add the appropriate water content, as determined in **e.2.d.1.**, and thoroughly mix.

**e.2.d.3.** Oven dry the aggregate mix at approximately  $110^{\circ}\text{C}$  ( $230^{\circ}\text{F}$ ) to a constant mass.

**e.2.d.4.** Combine the virgin aggregate material with the reclaimed material, if applicable, and thoroughly mix. Heat the combined aggregate and asphalt within limits of the mixing temperature determined in **d.1.** Charge the mixing bowl with the heated aggregate and form a crater in the top. Add the required amount of asphalt and mix the aggregate and asphalt until thoroughly coated, at least 2 minutes. Care should be taken to keep all of the sample in the mixing bowl during this process.

### 5.9.15 BULK SPECIFIC GRAVITY AND UNIT WEIGHT OF COMPACTED HOT MIX ASPHALT (HMA) (Kansas Test Method KT-15)

#### **1. SCOPE**

This method of test covers the procedure for determining the bulk specific gravity of specimens of compacted asphalt mixtures. The specimens may have been molded in the laboratory or cut or cored from compacted pavements. **KT-15** reflects testing procedures found in **AASHTO T 166** and **AASHTO T 331**.

#### **2. REFERENCED DOCUMENTS**

**2.1.** Part V, 5.9.; Sampling and Test Methods Foreword

**2.2.** AASHTO T 166; Bulk Specific Gravity of Compacted Hot Mix Asphalt (HMA) Using Saturated Surface – Dry Specimens

**2.3.** AASHTO T 331; Bulk Specific Gravity and Density of Compacted Hot Mix Asphalt (HMA) Using Automatic Vacuum Sealing Method

#### **3. APPARATUS**

**3.1.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

**3.2.** Wire basket formed of No. 4 (4.75 mm) mesh hardware cloth, 1/4 in (6.3 mm) mesh or perforated shelf or suitable bucket. The size shall be sufficient to fully support the specimen.

**3.3.** Container with overflow device, for immersing the wire basket, shelf or bucket in water and maintaining a constant water level.

**3.4.** Measuring device to establish the physical dimensions of a specimen.

**3.5.** Vacuum chamber with a 1.25 h (0.93kW) pump capable of evacuating a sealed and enclosed chamber to 29.5 in Hg vacuum (100 kPa vacuum) in less than 60 seconds. The chamber shall be large enough to seal samples of 6 in (150 mm) wide by 14 in (350 mm) long by 6 in (150 mm) thick. The device shall automatically seal the plastic bag and exhaust air back into the chamber in a controlled manner to ensure proper conformance of the plastic to the asphalt specimen.

**3.6.** Plastic bags used with the vacuum device shall be one of the two following sizes. The smaller bags shall have a minimum opening of 9.25 in (235 mm) and a maximum opening 10.25 in (260 mm). The larger bags shall have a minimum opening of 14.75 in (275 mm) and a maximum opening of 15.5 in (294 mm).

**3.7.** Specimen sliding plate used within the vacuum chamber for reduction of friction on the plastic bags.

## 4. PROCEDURE

**4.1.** The bulk specific gravity of a compacted asphalt mix specimen is determined by computing the ratio of its mass in air to its bulk volume. Procedure I is a rapid method which generally provides sufficient accuracy for the routine testing of specimens with dense, impermeable surfaces. Procedure II corresponds to **AASHTO T 331** test method for Bulk Specific Gravity and Density of Compacted Hot Mix Asphalt (HMA) Using Automatic Vacuum Sealing Method. Procedure III is a laboratory method which is used to determine the bulk specific gravity of saturated specimens, and corresponds to **AASHTO T 166, Method A**. This method is most suitable for testing specimens with slightly permeable surfaces in order to obtain the water absorption. Procedure IV is a method which establishes the bulk specific gravity of specimens which are composed of “open” mixes that typically display high porosity and permeability. In the event of dispute, Procedure IV will take precedence over Procedures I & II. Marshall and Superpave design specimens molded at the estimated “optimum” asphalt content will be subjected to Procedure III to determine the water absorption (by volume). If the water absorption is equal to or greater than 2.0%, Procedure II shall be used for both design and routine or field purposes.

**4.1.1.** Constant mass shall be defined as the mass at which further drying does not alter the mass by more than 0.05%. Initially dry the specimen overnight by either placing in an oven at  $125 \pm 5^\circ\text{F}$  ( $52 \pm 3^\circ\text{C}$ ) or by placing in front of a fan on an elevated wire rack and then weigh the next day at one-hour<sup>1</sup> intervals.

**4.1.2.** Specimens are defined to be at room temperature when meeting the following procedure: Check surface temperature. Let the specimen set for 5 minutes while at ambient air conditions (no flow of any type should be flowing across the specimen). Recheck the surface temperature. The original check and recheck must fall within  $77 \pm 5^\circ\text{F}$  ( $25 \pm 3^\circ\text{C}$ ) or the specimen temperature has not stabilized to room temperature.

### 4.2. Procedure I

**4.2.1.** Weigh specimen at room temperature to the nearest 0.1 g after it has attained room temperature.

**4.2.2.** Place the specimen in the basket or bucket and determine its mass to the nearest 0.1 g while immersed in water with a temperature of  $77 \pm 2^\circ\text{F}$  ( $25 \pm 1^\circ\text{C}$ ). The mass of the specimen in water shall be determined as quickly as possible after the specimen is immersed. This method should not be used if the specimen contains open or interconnecting voids.

### 4.3. Procedure II

**4.3.1.** Dry the specimen to constant mass and weigh it to the nearest 0.1g.

**4.3.2.** Cool the specimen to room temperature.

**4.3.3.** Select an appropriate size bag. For all 4 in (100 mm) diameter samples and samples with 6 in (150 mm) diameter and less than 2 in (50 mm) thickness, it is possible to use the bag with the smaller opening size.

**4.3.4.** Place a bag inside the vacuum chamber on top of the sliding plate.

**4.3.5.** Gently open the bag and place the specimen in the plastic bag on top of the sliding plate, while being careful not to handle the bag in such a manner that would create a puncture.

---

<sup>1</sup> **AASHTO T 166** and **T 331** require a two-hour interval.

**4.3.6.** Allow the vacuum chamber to remove the air from the chamber and the plastic bag. The vacuum chamber shall automatically seal the bag once the air is removed.

**4.3.7.** Exhaust air into the chamber until the chamber door opens indicating atmospheric pressure within the chamber. The chamber door latch can be used to avoid automatic opening of the door after completion of the test.

**4.3.8.** Remove the sealed specimen from the vacuum chamber. Handle the sealed specimen with extreme care.

**4.3.9.** Weigh the sealed specimen in air to the nearest 0.1g.

**4.3.10.** Weigh the sealed specimen while immersed in water at  $77 \pm 2^{\circ}\text{F}$  ( $25 \pm 1^{\circ}\text{C}$ ) to the nearest 0.1 g. Verify that no air bubbles are entrapped underneath the plastic bag material. This can be accomplished by placing the sealed specimen in water with the plastic bag oriented in a vertical direction.

**4.3.11.** Reweigh the sealed specimen in air to the nearest 0.1 g.

#### **4.4. Procedure III**

**4.4.1.** For cores, dry the specimen to constant mass. Cool the specimen to room temperature and weigh the dry mass to the nearest 0.1 g, and record as A. Immerse the specimen in a  $77 \pm 2^{\circ}\text{F}$  ( $25 \pm 1^{\circ}\text{C}$ ) water bath, let saturate for  $4 \pm 1$  minutes, then weigh and record mass as C. Remove the immersed and saturated specimen from the water bath, quickly damp dry the saturated specimen with a damp absorbent cloth and as quickly as possible, weigh and record the specimen as B. Any water which seeps from the specimen during the weighing operation is considered as part of the saturated specimen.

**NOTE:** If desired, the sequence of testing operations can be changed to expedite the test results. For example, first the mass of saturated damp dry specimen can be taken. Then the saturated specimen in water can be weighed. The dry mass of the specimen can be determined last.

**NOTE:** Terry cloth has been found to work well for an absorbent cloth. Damp is considered to be when no water can be wrung from the towel.

#### **4.5. Procedure IV**

**4.5.1.** Dry the specimen to constant mass.

**4.5.2.** After the specimen has cooled to room temperature, weigh it to the nearest 0.1 g (see **Section 4.4.1.1** of this test method).

**4.5.3.** Measure the height of the specimen to the nearest 0.001 in (0.025 mm) at four approximately equally spaced locations and average the four measurements. The diameter of the test specimen shall be determined to the nearest 0.001 in (0.025 mm) by averaging three diameters measured at approximately  $120^{\circ}$  from each other at about mid-height of the specimen. The average diameter shall be used in calculations.

## 5. CALCULATIONS

A = Mass of dry specimen in air, g.

B = Mass of saturated specimen in air after 4 minutes in water, g.

C = Mass of saturated specimen in water, g.

D = Mass of sealed specimen in air, g.

E = Mass of sealed specimen in water, g.

F = Apparent specific gravity of plastic sealing material at  $77 \pm 2^\circ\text{F}$  ( $25 \pm 1^\circ\text{C}$ ).

V = Calculated volume of specimen at  $77 \pm 2^\circ\text{F}$  ( $25 \pm 1^\circ\text{C}$ ).

G = Mass of specimen weighed immediately in water, g.

d = Specimen diameter (in [mm]).

h = Specimen height (in [mm]).

### 5.1. Procedure I: Bulk Specific Gravity ( $G_{mb}$ )

$$G_{mb} = \frac{A}{(A-G)}$$

### 5.2. Procedure II: Bulk Specific Gravity of Plastic Sealed Specimens

$$G_{mb} = \frac{A}{(D - E) - \left(\frac{D-A}{F}\right)}$$

### 5.3. Procedure III: Bulk Specific Gravity and Absorption of Saturated Samples

$$G_{mb} = \frac{A}{(B-C)}$$

Calculate the percent of water absorbed by the specimen as follows:

$$\% \text{ Water Absorbed (Volume Basis)} = \frac{100 \times (B-A)}{(B-C)}$$

#### 5.4. Procedure IV: Bulk Specific Gravity by Physical Dimensions

$$\text{Vol (in}^3\text{)} = (0.7854) (d^2) (h) \text{ (English)}$$

$$\text{Vol (mm}^3\text{)} = (0.7854) (d^2) (h) \text{ (SI)}$$

$$\text{Unit wt. (lb/ft}^3\text{)} = \frac{3.8096 (\text{mass in grams})}{\text{Volume in in}^3} \text{ (English)}$$

$$\text{Unit wt. (kg/m}^3\text{)} = \frac{1,000,000 (\text{mass in grams})}{\text{Volume in mm}^3} \text{ (SI)}$$

$$G_{mb} = \frac{\text{Unit weight in lb/ft}^3}{62.243^d} \text{ (English)}$$

$$G_{mb} = \frac{\text{Unit weight in kg/m}^3}{997.04^d} \text{ (SI)}$$

**NOTE:** Density of water varies based on temperature. Since the water bath temperature is fixed at  $77 \pm 2^\circ\text{F}$  ( $25 \pm 1^\circ\text{C}$ ), use the specified values. For tests not restrained by the  $77 \pm 2^\circ\text{F}$  ( $25 \pm 1^\circ\text{C}$ ) requirement, temperature correction can be determined by selecting the proper density for water from **Table 1**.

**Table 1**  
**Density of Water**

Temperature		Density	
°C	°F	kg/m <sup>3</sup>	lb/ft <sup>3</sup>
15	59.0	999.09	62.371
16	60.8	998.94	62.362
17	62.6	998.77	62.351
18	64.4	998.60	62.341
19	66.2	998.40	62.328
20	68.0	998.20	62.316
21	69.8	997.99	62.302
22	71.6	997.77	62.289
23	73.4	997.54	62.274
24	75.2	997.30	62.259
25	77.0	997.04	62.243
26	78.8	996.78	62.227
27	80.6	996.50	62.209
28	82.4	996.23	62.193
29	84.2	995.94	62.175
30	86.0	995.65	62.156
31	87.8	995.34	62.137
32	89.6	995.03	62.118
33	91.4	994.70	62.097
34	93.2	994.37	62.077
35	95.0	994.03	62.055

**NOTE:** The table was derived from the table 10-28 of Lange's Handbook of Chemistry; Twelfth Edition; Copyright 1979.

#### 5.5. SG<sub>corr.</sub>

$$SG_{\text{corr.}} = \left( \frac{d_w}{997.04} \right)$$

Where:  $d_w$  = density of water at temperature other than  $77 \pm 2^\circ\text{F}$  ( $25 \pm 1^\circ\text{C}$ ).

### 6. PRECISION

**6.1.** Duplicate determinations by multi laboratory, multi operator shall check to within 0.031. This value is derived from the 2006 Independent Assurance Gyratory Comparisons.

**5.9.25 SAMPLING AND SPLITTING PLANT MIXED ASPHALT MIXTURES**  
**(Kansas Test Method KT-25)**

**1. SCOPE**

This method covers the procedure for sampling plant mixed asphalt mixtures from truck beds, continuous mix plants, and roadways. The procedure for sampling from trucks may be followed when sampling asphalt mixtures from other containers or in stockpiles. **KT-25** reflects testing procedures found in **AASHTO R 97**.

**2. REFERENCED DOCUMENTS**

**2.1.** AASHTO T 168; Standard Method of Test for Sampling Bituminous Paving Mixtures

**2.2.** AASHTO R 47; Standard Practice for Reducing Samples of Asphalt Mixtures to Testing Size

**3. APPARATUS**

**3.1.** Square pointed shovel or scoop.

**3.2.** Sampling Devices.

**3.2.1.** Plants shall be equipped with sampling devices capable of providing a sample of sufficient size from the full width of the mixer discharge flow. Sampling devices shall be designed so those samples may be taken while the plant is operating at normal production rates.

**3.2.2.** A container that will hold a minimum of 55 lb (25 kg) of loose, hot asphalt mixtures. The container should be equipped with a handle or handles that will permit it to be easily carried.

**4. SAMPLING PROCEDURE**

**4.1.** Plant Discharge.

**4.1.1.** Drum plants shall be capable of sampling at the discharge outlet. When a sample is taken at the discharge, the sampling container shall be of sufficient size to accommodate the entire stream uniformly. If a by-pass chute is utilized, a representative sample shall be obtained.

**4.1.2.** Take the sample in at least three increments to obtain the total sample. Combine the increments and mix thoroughly.

**4.1.3.** The combined sample size shall be at least four times the amount required for testing.

**4.2.** Truck Beds.

**4.2.1.** Divide the truck bed into at least three areas of approximately equal size.

**4.2.2.** Dig a hole about 1 ft (0.3 m) deep at a point that will be representative of each area.

**4.2.3.** Take a sample weighing 4 to 6 lb (2 to 3 kg) near the bottom of each hole, taking care to prevent segregation.

**4.2.4.** Combine the individual samples into a single sample at least four times the amount required for testing.

**4.3. Roadways Prior to Compaction.**

**4.3.1.** Randomly select the truckload in which the sample is to be obtained. Calculate the expected yield of that truckload and obtain at least three approximately equal increments from the roadway within the randomly selected truckload. These increments shall be the full depth of the lift, full width of the laydown machine minus 2 ft (ignore 1 ft on both edges of the laydown machine).

**4.3.2.** Insert the template through the full depth of the lift and remove all of the loose material above the tack layer from the template. Combine the increments and mix thoroughly.

**NOTE:** An approximate 12 in (300 mm) square template can be used to obtain the sample. Size and shape of the template can be altered to best fit the required sampling quantity without segregating the material. Take the number of squares required to obtain the necessary quantity for testing.

**4.3.3.** The sample size shall be at least four times the amount required for testing. For Superpave projects, the minimum sample size is shown in the specifications.

**4.3.4. EXAMPLE:**

Assume the yield for the random truckload of HMA is 100' long for a 12' wide roadway. Excluding the outside 1' edges, the width of the sampled area is 10'. Divide both the width and the length by 3 to obtain potentially 9 equal sublots for obtaining the sample. If only 3 sublots (the minimum) are to be used to create the sample, then select the sublots so that each third of the length is represented and each third of the width is represented by the sublots. In this example, sublots 1B, 2C and 3A were selected. When more than 3 sublots are to be used, then continue to select the additional material from sublots not yet selected varying the length segment and width segment i.e., sublots 3C, 2B and 1A etc.

3 segments at ~33' each = 100'

The expected yield of the truckload in this example is 100' x 12'

## **5. SAMPLE SPLITTING AND REHEATING**

**5.1.** Reduce sample to the required size by splitting or quartering in the following manner:

**5.1.1.** Spread a sheet of paper (Kraft or similar) on a hard, clean, smooth and level surface. Place the sample in a pile near the center of the paper and mix by alternately lifting each corner towards the opposite corner thereby rolling the mixture to the opposite corner. This should be performed in a vigorous manner. Placing the sample on clean sheet metal and mixing thoroughly with a trowel is an acceptable alternative.

**5.1.2.** Divide the pile into four equal quarters with a straightedge (trowel or similar metal blade) and completely remove two pre-selected diagonally opposite quarters.

**5.1.3.** Continue this quartering procedure until the original sample is reduced to the approximately desired size. On the final quartering step, if the sample is too large before quartering, but will be too small after quartering, the sample pile is divided into equal opposite sectors but unequal adjacent sectors. This can be accomplished by varying the dividing angle at the center of the sample pile from the normal 90°. Opposite sections can then be selected to obtain the desired sample size.

**5.2.** After mixing and reducing, samples may be reheated briefly, if necessary, to bring to specified compaction temperature. Care must be exercised to avoid overheating any part of the sample. Insulated containers are recommended for transporting and storing samples until used.

**5.9.31 DETERMINATION OF PERCENTAGE OF CRUSHED PARTICLES IN CRUSHED GRAVEL**  
**(Kansas Test Method KT-31) AKA: COARSE AGGREGATE ANGULARITY**

**1. SCOPE**

This method of test covers the procedure for determining the percent, by mass, of particles, which by visual inspection, exhibit characteristics of crushed aggregate. **KT-31** reflects testing procedures found in ASTM D5821.

**2. REFERENCED DOCUMENTS**

**2.1.** Part V, 5.9; Sampling and Test Methods Foreword

**2.2** KT-01; Sampling and Splitting of Aggregates

**2.3.** ASTM E11; Standard Specification for Woven Wire Test Sieve Cloth and Test Sieves

**3. APPARATUS**

**3.1.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

**3.2.** Sieves meeting **ASTM E11** of appropriate sizes.

**3.3.** Drying Pans.

**3.4.** Oven capable of maintaining a uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**4. SAMPLE PREPARATION**

**4.1.** Obtain the test sample by quartering or splitting according to **KT-01** from material which has been thoroughly mixed. The sample shall be of sufficient size to yield the minimum dry mass shown in **Table 1** after washing over the No. 4 (4.75 mm) sieve. Screen the sample over a No. 4 (4.75 mm) sieve and discard all material passing the sieve. Wash the retained material over a No. 4 (4.75 mm) sieve and dry the sample to a constant mass at  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**TABLE 1**

<b>Nominal Maximum Aggregate Size</b>		<b>Minimum Dry Sample Mass</b>
1 ½" (37.5 mm)		6 lb (2500 g)
1" (25.0 mm)		3.5 lb (1500 g)
¾" (19.0 mm)		2.2 lb (1000 g)
½" (12.5 mm)		1.5 lb (700 g)
⅜" (9.5 mm)		0.9 lb (400 g)
No. 4 (4.75 mm)		0.5 lb (200 g)

**NOTE:** Nominal maximum aggregate size is one size larger than the first sieve to retain more than 10%.

## 5. TEST PROCEDURE

**NOTE:** For test procedures requiring the determination of two or more fractured faces go to Section 6. of this test method.

**5.1.** Weigh the material retained on the No. 4 (4.75 mm) sieve to the nearest gram. Record this mass as the original dry mass.

**5.2.** Spread the material in a thin layer on a clean flat surface so that each particle can be examined.

**5.3.** Separate the crushed particles from uncrushed particles. Any particle appearing to have one or more fractured faces shall be considered a crushed particle.

**NOTE:** Crushed particles are defined as 25% or more of the particle having a fractured face. A fractured face is defined as an angular, rough or broken surface of an aggregate particle. (See Figure 1)

**Figure 1**  
**Schematic of a Fractured Particle with One Fractured Face**

A face will be considered a “Fractured Face” only if  $A_f \geq 0.25 X_{max}$

**5.4** Determine the mass to the nearest gram and record as mass of crushed particles.

## 6. TEST PROCEDURE FOR SPECIFICATIONS REQUIRING DETERMINATION OF ONE OR MORE AND TWO OR MORE FRACTURED FACES

**6.1.** Weigh the material retained on the No. 4 (4.75 mm) sieve to the nearest gram. Record this mass as the original dry mass.

**6.2.** Spread the material in a thin layer on a clean flat surface so that each particle can be examined.

**6.3.** Separate the crushed particles into three piles; uncrushed particles, particles with two or more fractured faces and particles with one fractured face.

**NOTE:** Crushed particles are defined as 25% or more of the particle having a fractured face. A fractured face is defined as an angular, rough or broken surface of an aggregate particle. (See **Figure 1**)

**6.4.** Determine the mass to the nearest gram of each pile with crushed faces and record as:

F<sub>1</sub>=Mass of particles with one fractured face

F<sub>2</sub>=Mass of particles with two or more fractured faces

## **7. CALCULATIONS**

**7.1. For specifications requiring determination of only one or more fractured faces:**

$$\text{Percent Crushed Particles} = \frac{100(\text{Mass of Crushed Particles})}{\text{Original Dry Mass}}$$

**7.2. For specifications requiring determination of one or more and two or more fractured faces:**

**NOTE:** Skip **Sect. 7.2.** for specifications not requiring the determination of two or more fractured faces.

Compute the percentage of crushed particles for specifications requiring the determination of two or more fractured faces using the following formulas:

$$\text{Percent Crushed Particles with 1 or more Fractured Faces} = \frac{100(F_1 + F_2)}{\text{Original Dry Mass}}$$

$$\text{Percent Crushed Particles with 2 or more Fractured Faces} = \frac{100(F_2)}{\text{Original Dry Mass}}$$

## **8. REPORT**

**8.1.** Record to the nearest 0.1% of crushed particles. Report the results to 1% crushed particles.

## 5.9.32 METHOD OF TEST FOR DENSITY OF COMPACTED ASPHALT MIXTURES BY NUCLEAR METHOD (Kansas Test Method KT-32)

### **1. SCOPE**

This method of test covers the procedure for measuring the “in-place” density of compacted asphalt materials by attenuation of gamma radiation. The intensity of the radiation detected is dependent in part on the density of the material being tested. **Gauge calibration shall follow Section 5.8.2. of this manual INDEPENDENT ASSURANCE REPLICATE (ASR) CHECK FOR NUCLEAR DENSITY GAUGES.** KDOT gauges shall be calibrated-annually.

**The equipment utilizes radioactive materials which may be hazardous to the health of users unless proper precautions are taken. (For KDOT field personnel only: Refer to Standard Operating Manual No. 1.13.2.).**

### **2. REFERENCED DOCUMENTS**

**2.1.** KT-14; Marshall Test of Bituminous Mixes

**2.2.** KT-15; Bulk Specific Gravity and Unit Weight of Compacted Hot Mix Asphalt (HMA)

**2.3.** KT-39; Theoretical Maximum Specific Gravity of Asphalt Paving Mixtures

**2.4.** Section 5.2.2.2.; Random Sampling

### **3. APPARATUS**

**NOTE:** Check gauge to verify it is in asphalt mode.

**3.1.** Nuclear density gauge with supporting equipment including reference standard, survey meter, and instructional material.

**3.2.** Core drilling equipment capable of drilling a nominal 4 in (100 mm) diameter core.

**3.3.** Standardization.

**3.3.1.** Standardization of the nuclear gauge on a reference standard block is required at the start of each day’s use and when test measurements are suspect.

**3.3.2.** Warm up the nuclear gauge in accordance with the manufacturer’s recommendations.

**3.4.** Properly seat the nuclear gauge on the standard block. Take a four-minute reading on the reference standard. The density standard should be within 1% of the density for the previous day’s reading. If not,

repeat the standard count. The two numbers should now be within 1% of each other and within 2% of the density for the previous day's reading. If not, check the machine for malfunction.

#### **4. TEST SITE SELECTION AND PREPARATION**

**4.1.** Location of the test site should be on a random basis as described in **Section 5.2.2.2. RANDOM SAMPLING** of this manual. Regardless of the method of random selection chosen, it shall satisfy the requirement that any area of the surface shall have an equal chance of being sampled, except sampling shall not be conducted on sites closer than 1 ft (0.3 m) to an unconfined edge or vertical surface such as a raised edge of curb and gutter, etc. When the randomized selection method indicates a site within 1 ft (0.3 m) of an exposed edge or vertical surface, it is permissible to move the gauge transversely to clear the 1 ft (0.3 m) restriction. It is also permissible to determine an alternate location using the tables again.

**4.2.** Since the measured values of density are affected by the surface texture of the material immediately beneath the gauge, a flat surface should be tested for best results, both during calibration and density testing. If the mix has a coarse surface, it is likely that the results will vary widely.

**4.3.** It may be necessary to use a leveling sand of minus No. 30 (600  $\mu\text{m}$ ) material to obtain the best results with the density gauge. The leveling sand, as defined for this test, is minus No. 30 (600  $\mu\text{m}$ ) with no more than 20% represented by minus No. 100 (150  $\mu\text{m}$ ). It is recommended that the leveling sand material be from the same source as one of the individual aggregates in the mixture.

**4.4.** For HMA mix designs designated as A mixes, no sand is required. All other mix designs should be checked to determine if the leveling sand is needed before any field calibration of the nuclear density gauge is attempted. This is accomplished by doing the following:

**4.4.1.** Sit the gauge on a smooth level location and mark location with lumber crayon.

**4.4.1.1.** For uniformity, the gauge operator shall position the source rod so it is closest to the laydown machine (point the gauge towards the roller).

**4.4.2.** Take 5 one-minute readings with the density gauge, record wet density values, discard the single highest and lowest values, average the three remaining values, and record the average value.

**NOTE:** Check tip of source rod to assure it is free of any foreign substance (i.e. grease, asphalt, concrete, etc.).

**4.4.3.** Inside the location marked with the lumber crayon (test site) thinly spread a sufficient amount of minus No. 30 (600  $\mu\text{m}$ ) material. Smooth and level the minus No. 30 (600  $\mu\text{m}$ ) material with the metal plate or a straight edge.

**4.4.4.** Place the density gauge on the test site after the placement of minus No. 30 (600  $\mu\text{m}$ ) material and take another density reading. Take care to use the same count time and location of source rod. Record wet density information obtained. It is recommended that this process be completed at three locations.

**4.4.5.** After the information has been obtained, determine the need for the minus No. 30 (600  $\mu\text{m}$ ) material leveling sand. Use the leveling sand if an increase of 1  $\text{lb/ft}^3$  (16  $\text{kg/m}^3$ ) or more is noted. If the leveling sand demonstrates a decrease in density, then the leveling sand is not beneficial and should not be used. An example of this calculation is as follows:

TEST SITE LOCATION	TEST SITE DENSITY $\text{lb/ft}^3$ ( $\text{kg/m}^3$ )	TEST SITE DENSITY WITH LEVELING SAND $\text{lb/ft}^3$ ( $\text{kg/m}^3$ )	DIFFERENCE $\text{lb/ft}^3$ ( $\text{kg/m}^3$ )
1	138.45 (2215)	139.50 (2232)	+1.05 (17)
2	140.35 (2246)	141.60 (2266)	+1.25 (20)
3	141.95 (2271)	143.06 (2289)	+1.11 (18)

**NOTE:** Density readings in above example are the average 3 one-minute readings (see **Section 4.4.2.** of this test method).

The difference in the example shows an increase in the density of more than 1  $\text{lb/ft}^3$  (16  $\text{kg/m}^3$ ) when the leveling sand is used. If it is determined that leveling sand will be used during the calibration process of the nuclear gauge then it is required that leveling sand be used during in-place density testing of the compacted asphalt.

## 5. CALIBRATION CURVE ADJUSTMENT

**5.1.** The manufacturer's calibration curve may require adjustment for chemical composition or density. Examination to determine the need for such adjustment should be made whenever a change is made in either the material to be tested or testing equipment. This test is generally conducted by comparing nuclear gauge to core density values for four or more random locations. The difference between the two average density values are used to determine the correction factor ( $d_b$ ) in **Section 7.6.1.1.** of this test method.

## 6. CALIBRATION LOCATIONS

**6.1.** For rural areas: Select locations starting after the second truck load. Each transverse and longitudinal random location shall fall within every other truck load.

**6.2.** For urban areas: If the asphalt mix quantities are large enough, use the rural criteria. If not, then decide if coring alone is a more feasible approach; or use best judgment to get a representative calibration for the nuclear gauge.

## 7. CALIBRATION PROCEDURE

**7.1.** Select a minimum of five locations that are typical of the asphalt mix being produced.

**7.1.1.** For uniformity, the gauge operator shall position the source rod so it is closest to the laydown machine (point the gauge towards the roller).

**7.2.** Take 5 one-minute readings in each location with the nuclear gauge in the backscatter or direct transmission (see **Section 8.2.** of this test method) position and mark the outline of the gauge in these locations. Record wet density values, discard the single highest and lowest values, average the three remaining values, and record the average value.

**NOTE:** Check tip of source rod to assure it is free of any foreign substance (i.e. grease, asphalt, concrete, etc.).

**7.3.** Record the wet density (WD) directly from the nuclear gauge. Specific instructions on the individual gauges are in the manufacturer's instruction manual which is in the packet accompanying each gauge.

**7.4.** Take three cores from each of the marked areas. For lifts other than base course, it may be necessary to use a bond breaker.

**7.5.** Obtain the core density using **KT-15**.

#### **7.6. Calculations**

**7.6.1.** For each location subtract the average nuclear density from the average core density. Evaluate these differences for outliers by the "T" Statistic Test at the 95% confidence level. The following example illustrates the point:

##### **7.6.1.1. "T" STATISTIC EXAMPLE:**

#### **CALCULATIONS FOR CALIBRATION OF NUCLEAR GAUGES ON ASPHALT PAVEMENT**

$n$  = Number of locations

$d_i$  = Core Density – Nuclear Density

$d_b = \sum d_i / n$  = Correction Factor = Mean

$s$  = Sample Standard Deviation

lb/ft<sup>3</sup> (kg/m<sup>3</sup>) Nuclear = Nuclear Density, Average of 3 one-minute readings

lb/ft<sup>3</sup> (kg/m<sup>3</sup>) Cores = Core Density, Average of three cores

**Table 1**  
**REJECTION QUOTIENTS ( $T_{0.95}$ )**

n	$T_{0.95}$
2	-----
3	1.15
4	1.46
5	1.67
6	1.82
7	1.94
8	2.03
9	2.11
10	2.18

Assume cores and nuclear readings for the calibration are as follows. Calculate the difference ( $d_i$ ) between cores and nuclear gauge readings.

**SI EXAMPLE:**

Location	Cores (kg/m <sup>3</sup> )	Nuclear (kg/m <sup>3</sup> )	Difference( $d_i$ ) (kg/m <sup>3</sup> )
1	2176	2133	43
2	2187	2160	27
3	2176	2141	35
4	2197	2168	29
5	2185	2152	<u>33</u>
Total			+167

Calculate the correction factor ( $d_b$ )

$$d_b = \frac{\sum d_i}{n} = \frac{+167}{5} = +33.4$$

and standard deviation ( $s$ ) between the cores and nuclear gauge readings as follows:

Location	Cores	Nuclear	$d_i$	$d_i - d_b$	$(d_i - d_b)^2$
1	2176	2133	+43	+9.6	92.16
2	2187	2160	+27	-6.4	40.96
3	2176	2141	+35	+1.6	2.56
4	2197	2168	+29	-4.4	19.36
5	2185	2152	<u>+33</u>	<u>-0.4</u>	<u>0.16</u>
Total			+167		155.20

$$s = \sqrt{\frac{\sum (d_i - d_b)^2}{(n-1)}} = \sqrt{\frac{155.20}{4}} = 6.23$$

**ENGLISH EXAMPLE:**

Location	Cores (lb/ft <sup>3</sup> )	Nuclear (lb/ft <sup>3</sup> )	Difference(d <sub>i</sub> ) (lb/ft <sup>3</sup> )
1	136.0	133.3	2.7
2	136.7	135.0	1.7
3	136.0	133.8	2.2
4	137.3	135.5	1.8
5	136.4	134.4	<u>2.0</u>
Total			10.4

Calculate the correction factor (d<sub>b</sub>)

$$d_b = \frac{\sum d_i}{n} = \frac{+10.4}{5} = +2.1$$

and standard deviation (s) between the cores and nuclear gauge readings as follows:

Location	Cores	Nuclear	d <sub>i</sub>	d <sub>i</sub> -d <sub>b</sub>	(d <sub>i</sub> -d <sub>b</sub> ) <sup>2</sup>
1	136.0	133.3	+2.7	+0.6	0.36
2	136.7	135.0	+1.7	-0.4	0.16
3	136.0	133.8	+2.2	+0.1	0.01
4	137.3	135.5	+1.8	-0.3	0.09
5	136.4	134.4	<u>+2.0</u>	<u>-0.1</u>	<u>0.01</u>
Total			+10.4		0.63

$$s = \sqrt{\frac{\sum (d_i - d_b)^2}{(n-1)}} = \sqrt{\frac{0.63}{4}} = 0.40$$

Application of the “T” test requires the following steps:

1. Arrange the deviations (d<sub>i</sub>) in ascending order of magnitude.

(SI)	(ENGLISH)
d <sub>1</sub> = 27	1.7
d <sub>2</sub> = 29	1.8
d <sub>3</sub> = 33	2.0
d <sub>4</sub> = 35	2.2
d <sub>5</sub> = 43	2.7

2. Calculate the difference between the questionable measurement (d<sub>1</sub> or d<sub>n</sub>) and the mean (d<sub>b</sub>). Then divide the deviation from the mean (d<sub>b</sub> - d<sub>1</sub> or d<sub>n</sub> - d<sub>b</sub>) by the sample standard deviation (s), demonstrated by the

formula "T" (illustrated below). Thus, if the questionable measurement (the measurement demonstrating the greatest variance from the other measurements) is the first measurement ( $d_1$ ) in the arranged set of results.

$$T = \frac{d_b - d_1}{s}$$

If the questionable measurement is the last measurement ( $d_n$ ) in the arranged set of results.

$$T = \frac{d_n - d_b}{s}$$

3. If the "T" is equal to or greater than the  $T_{0.95}$  value (for 95% confidence limits) for the number (n) of results considered (See Table 1) the questionable measurement may be rejected with 95% confidence that some definite error is involved in this measurement which was not involved in the other measurements of the set. For this example, the questionable measurement is  $d_5$  because it demonstrates the largest spread from the other measurements.

$$T (SI) = \frac{d_n - d_b}{s} = \frac{43 - 33.4}{6.23} = 1.54$$

$$T (ENGLISH) = \frac{d_n - d_b}{s} = \frac{2.7 - 2.1}{0.40} = 1.50$$

For  $n = 5$ ,  $T = 1.67$  (Table 1). Calculated T is less than 1.67; therefore, this value is not rejected (not an outlier). If the T value had been equal to or greater than 1.67, discard the core results from this location. Recalculate **Section 7.6.1.1** of this test method using the remaining core results.

**NOTE:** When calibrating multiple gauges, if it becomes necessary to discard a location or locations because the location or locations failed either the standard deviation ( $s$ ) or the "T" test, then the same location or locations **must** be discarded for all gauges being calibrated using these set of cored locations.

**7.6.2.** A minimum of four data points must pass the T-test in **Section 7.6.1** of this test method. The standard deviation ( $s$ ) should be less than or equal to 2.0 lb/ft<sup>3</sup> (32 kg/m<sup>3</sup>). If it is larger than 2.0 lb/ft<sup>3</sup> (32 kg/m<sup>3</sup>), this calibration shall be discarded.

**7.6.3.** The correction factor ( $d_b$ ) is applied to each nuclear density reading on the project to obtain a corrected nuclear density.

## 8. TEST PROCEDURE (HOT MIX)

**8.1.** For uniformity, the gauge operator shall position the source rod so it is closest to the laydown machine (point the gauge towards the roller).

**8.1.1.** Backscatter mode: Properly seat the gauge as stated in **Section 4.4.1** of this test method and expose the source by depressing the source rod (or handle) to the first stop. Take 5 one-minute readings

with the density gauge, record wet density values, discard the single highest and lowest values, average the three remaining values, and record the average value.

**NOTE:** Check tip of source rod to assure it is free of any foreign substance (i.e. grease, asphalt, concrete, etc.).

**8.2.** For uniformity, the gauge operator shall position the source rod so it is closest to the laydown machine (point the gauge towards the roller).

**8.2.1.** Direct transmission mode: Create a hole 2" (50 mm) deeper than the thickness of the material being tested with the rod and hole forming device that is provided with the gauge. Lower the source rod into the hole to the predetermined depth.

**NOTE:** Check tip of source rod to assure it is free of any foreign substance (i.e. grease, asphalt, concrete, etc.).

**NOTE:** Always double check to make sure the probe is fully seated in the appropriate notch. This should be confirmed in the safe, backscatter, or any direct transmission position.

## **9. TEST PROCEDURE (COLD RECYCLE)**

**9.1.** Develop compaction growth curves (rolling sequence) for cold recycle material using the backscatter position. Compaction growth curves will help to determine optimum density of material for a given roller. Curves are developed by plotting the density of material against the accumulative roller passes (**D.O.T. FORM NO. 608 or 608M**).

**NOTE:** In determining data for compaction growth curves, it is not necessary to calibrate the gauge to the material. Also, a single one-minute count can be used to establish each point for the curve.

**9.2.** To determine in place density use either direct transmission or backscatter as approved by the district.

**9.3.** For uniformity, the gauge operator shall position the source rod so it is closest to the laydown machine (point the gauge towards the roller).

**9.3.1.** Take 5 one-minute readings with the density gauge, record wet density values, discard the single highest and lowest values, average the three remaining values, and record the average value.

**NOTE:** Check tip of source rod to assure it is free of any foreign substance (i.e. grease, asphalt, concrete, etc.).

## 10. CALCULATIONS

**10.1.** Calculation methods applicable to the various gauge types are covered in the Manufacturer's Operating Manual which accompanies the gauge and are not reproduced in this procedure.

**10.2.** Wet density (WD) values, as determined by the method appropriate to the type of gauge and method of calibration shall be compared to the "Density Standard" for determination of Percent of the Standard and Percent of Voids.

**10.3.** Density Standards.

**10.3.1.** Density Standard for Nuclear Density shall be defined as the average value of the most recent three laboratory density determinations (Field Mold Density) as determined by **KT-14** and **KT-15** for Marshall mix designations. When fewer than three laboratory densities for the particular mix designation or revised asphalt content are available, the "Density Standard" shall be the average of those determinations made until a total of three may be averaged.

**10.3.2.** For Superpave mixes, the "Density Standard" is established with the use of the average daily  $G_{mm}$  value (**KT-39**) as outlined in the specifications.

**10.4.** Calculate the Wet Density (WD) value from the following:

**10.4.1.** Wet Density (WD) = indicated lb/ft<sup>3</sup> (kg/m<sup>3</sup>) with the adjustment factor applied as determined in **Section 7. CALIBRATION PROCEDURE** of this test method.

**10.5.** Calculate the percent of standard from the following formula:

$$\text{Percent of Standard} = \frac{100 (\text{WD})}{\text{Density Standard}}$$

**10.6.** Calculate the percent voids from the following formula:

$$\text{Percent Voids} = 100 - \frac{100 (\text{WD})}{\text{Density of Water}^a (G_{mm})}$$

Where:  $G_{mm}$  = Theoretical maximum specific gravity of the mixture (refer to **KT-39**).

**NOTE:** Density of water varies based on temperature. Determine the temperature and select the proper density for water (see **KT-15, Table 1**).

## 11. REPORT AND RECORD

**11.1.** Report and record as 0.1 lb/ft<sup>3</sup> (1 kg/m<sup>3</sup>) or 0.01% of optimum density.

#### 5.9.34 SIEVE ANALYSIS OF EXTRACTED AGGREGATE (Kansas Test Method KT-34)

### **1. SCOPE**

This method of test covers the procedure for determination of the particle size distribution of aggregate extracted from asphalt mixtures. **KT-34** reflects testing procedures found in **AASHTO T 30**.

### **2. REFERENCED DOCUMENTS**

**2.1.** Part V, 5.9; Sampling and Test Methods Foreword

**2.2.** KT-02; Sieve Analysis of Aggregates

**2.3.** KT-57; Determination of Asphalt Content and Gradation of Hot Mix Asphalt Concrete by the Ignition Oven

**2.4.** ASTM E11; Woven Wire Test Sieve Cloth and Test

**2.5.** AASHTO T 30; Mechanical Analysis of Extracted Aggregate

### **3. APPARATUS**

**3.1.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

**3.2.** Appropriate sieves meeting ASTM E11.

**3.3.** Oven capable of maintaining a uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**3.4.** Drying Pans.

**3.5.** Wetting Agent. Any dispersing agent, such as dishwashing detergent, that promotes separation of the fine materials.

**3.6.** Container. Any container of sufficient size to contain the sample covered with water and to prevent any loss of material during agitation.

**3.7.** Large Spoon

**NOTE:** The use of a mechanical apparatus to perform the washing operation is not precluded, provided the results are consistent with those obtained using manual operations. The use of some mechanical washing equipment with some samples may cause degradation of the sample.

### **4. SAMPLE**

**4.1.** The sample shall consist of the entire sample of aggregate from the test for asphalt binder content of paving mixtures by ignition method (**KT-57**) from which the asphalt material has been extracted.

## 5. TEST PROCEDURE

**5.1.** The sample shall be dried to a constant mass at a temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ) and weighed to the nearest 0.1%. The total mass of the aggregate shall be the sum of the extracted aggregate and the mineral matter (ash) from the extracted asphalt binder.

**5.2.** The test sample shall be placed in a container and covered with water containing a sufficient amount of wetting agent to assure a thorough separation of the material finer than the No. 200 (75  $\mu\text{m}$ ) sieve. The use of a large spoon to stir and agitate the aggregate in the wash water has been found satisfactory.

**NOTE:** There should be enough wetting agent to produce a small amount of suds when the sample is agitated. The quantity will depend on the hardness of the water and the quality of the detergent. Excessive suds may overflow the sieves and carry some material with them.

**5.3.** The agitation shall be sufficiently vigorous to result in the complete separation from the coarse particles of all particles finer than the No. 200 (75  $\mu\text{m}$ ) sieve and bring them into suspension in order that they may be removed by decantation of the wash water. Care shall be taken to avoid, as much as possible, the decantation of the coarse particles of the sample. Repeat the operation without the wetting agent until the wash water is clear.

**5.4.** All materials retained on the sieves shall be returned to the container. The washed aggregate in the container shall be dried to constant mass at a temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ) and weighed to the nearest 0.1%.

**5.5.** The aggregate shall then be sieved according to procedures found in **KT-02 Section 6.1** through **Section 6.3**, of this manual. The cumulative mass of material retained on all of the sieves including the No. 200 (75  $\mu\text{m}$ ) sieve, plus the mass of dry material passing the No. 200 (75  $\mu\text{m}$ ) sieve by dry sieving must check the dried mass after washing within 0.2% of the total mass. The cumulative mass of the material retained on the various sieves shall be recorded. The mass of the material passing the No. 200 (75  $\mu\text{m}$ ) sieve, determined by subtracting the cumulative mass of the material retained on all sieves from the total mass of the sample, shall also be recorded.

## 6. CALCULATIONS

**6.1.** The mass of the material retained on the various sieves and the total passing the 75 $\mu\text{m}$  (No. 200) sieve shall be converted to percentages by dividing each by the total mass of the aggregate and multiplying by 100.

## 7. REPORT

**7.1.** The report shall include the results of the sieve analysis reported as the cumulative percentage retained on each sieve. The percent passing the No. 200 (75  $\mu\text{m}$ ) sieve shall also be reported. Percentages shall be reported to the nearest whole percent except for the percentage retained and passing the No. 200 (75  $\mu\text{m}$ ) sieve which shall be reported to the nearest 0.1%.

## 8. PRECISION

**8.1.** The estimates of precision for this test method are listed in **Table 1**. The estimates are based on the results from the **AASHTO Materials Reference Laboratory Proficiency Sample Program**, with testing conducted by **AASHTO T 30**. The data are based on the analyses of the test results from 47 to 90

laboratories that tested 17 pairs of proficiency test samples (Samples 1 through 34). The values in the table are given for different ranges of total percentage of aggregate passing a sieve.

**Table 1**  
**Precision**

	Total Percentage of Material Passing a Sieve		Standard Deviation (1S) Percent	Acceptable Range of Two Result—(D2S) Percent
Extracted Aggregate Single Operator Precision	<100	≥95	0.49	1.4
	<95	≥40	1.06	3.0
	<40	≥25	0.65	1.8
	<25	≥10	0.46	1.3
	<10	≥5	0.29	0.8
	<5	≥2	0.21	0.6
	<2	≥0	0.17	0.5
Multilaboratory Precision	<100	≥95	0.57	1.6
	<95	≥40	1.24	3.5
	<40	≥25	0.84	2.4
	<25	≥10	0.81	2.3
	<10	≥5	.056	1.6
	<5	≥2	0.43	1.2
	<2	≥0	0.32	0.9

**NOTE:** These numbers represent, respectively, (1S) and (D2S) limits described in Practice **ASTM C 670**.

**NOTE:** The precision estimates are based on aggregates with nominal maximum sizes of 3/4 in (19.0 mm) to 3/8 in (9.5 mm).

**5.9.39 THEORETICAL MAXIMUM SPECIFIC GRAVITY OF ASPHALT PAVING MIXTURES**  
**(Kansas Test Method KT-39)**

**1. SCOPE**

This method covers the determination of the theoretical maximum specific gravity of uncompacted asphalt paving mixtures. **KT-39** reflects testing procedures found in **AASHTO T 209**.

**2. REFERENCED DOCUMENTS**

**2.1.** Part V, 5.9; Sampling and Test Methods Foreword

**2.2.** KT-58; Method for Preparing and Determining the Density of Hot Mix Asphalt (HMA) Specimens by means of the Superpave Gyratory Compactor

**2.3.** AASHTO T 209; Theoretical Maximum Specific Gravity and Density of Hot-Mix Asphalt Paving Mixtures

**2.4.** ASTM E1; Specifications for ASTM Thermometers

**3. APPARATUS**

**3.1.** Vacuum container.

**3.1.1.** Two different vacuum containers are described. Each must be capable of withstanding the full vacuum applied, and each must be equipped with the fittings and other accessories required by the test procedure being employed. The hose opening shall be covered with a small piece of No. 200 (75  $\mu$ m) wire mesh to prevent vacuum pickup of particles during transfer of materials.

**3.1.2.** The vacuum container size depends on the minimum sample size requirements given in **Section 5.1.** of this test method. Avoid using a small sample in a large container.

**3.1.3.** Vacuum containers for weighing in water.

**3.1.3.1.** Type A: A glass, plastic or metal bowl with a minimum capacity of 2000 mL.

**3.1.3.2.** Type B: A thick-wall filter flask or a thick-wall vacuum desiccator with a minimum capacity of 2000 mL.

**3.2.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested. The balance shall be readable to 0.1% or better of the sample mass. For the bowl determination method the balance shall be equipped with a suitable suspension apparatus and holder to permit weighing the sample while suspended from the center of the scale pan of the balance.

**3.3.** Vacuum pump or water aspirator capable of evacuating air from the container to a residual pressure of 3.7 kPa (27 mm of Hg).

**3.3.1.** When a vacuum pump is used, a suitable trap of one or more 1000 mL filter flasks, or the equivalent, shall be installed between the vacuum vessel and vacuum source to reduce the amount of water vapor entering the vacuum pump.

**3.4.** Residual pressure manometer or vacuum gauge traceable to NIST (mandatory) to be connected directly to the vacuum vessel and to be capable of measuring residual pressure down to 3.7 kPa (27 mm Hg).

**NOTE:** A residual pressure of 4.0 kPa (30 mm Hg) absolute pressure is approximately equivalent to 97 kPa (730 mm Hg) reading on vacuum gauge at sea level.

**NOTE:** Residual pressure in the vacuum vessel measured in millimeters of mercury, is the difference in the height of the mercury in the Torricellian vacuum leg of the manometer and the height of mercury in the other leg of the manometer that is attached to the vacuum vessel.

**3.5.** Manometer or vacuum gauge, suitable for measuring the vacuum being applied at the source of the vacuum. This device can be connected directly to the vacuum source or be in the vacuum line close to the source. This is required to check the reading given by the residual pressure manometer attached directly to the vacuum vessel.

**NOTE:** The Torricellian vacuum leg of the manometer occasionally acquires one or more bubbles of air that introduce error into the residual pressure reading. By the addition of the vacuum gauge this error can often be quickly detected by the differences between the two vacuum measurements.

**3.6.** Thermometers, calibrated liquid-in-glass, total immersion type, of suitable range with graduations at least every 0.2°F (0.1°C) and a maximum scale error of 0.9°F (0.5°C) as prescribed in **ASTM E1**.

**3.7.** A draft oven capable of maintaining a uniform temperature of  $275 \pm 9^\circ\text{F}$  ( $135 \pm 5^\circ\text{C}$ ).

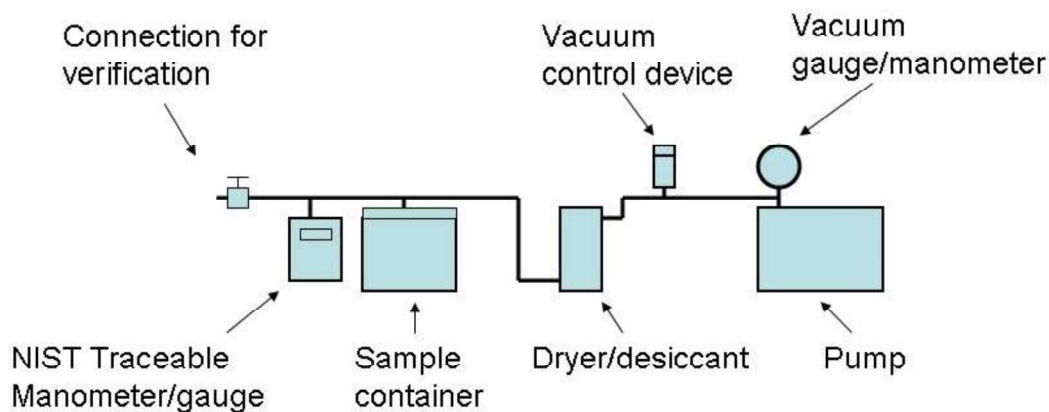

**3.8.** Water bath suitable for immersing the Type A or Type B container in water while suspended under the balance and equipped with an overflow outlet for maintaining a constant water level. Maintain a constant-temperature water bath at  $77 \pm 2^\circ\text{F}$  ( $25 \pm 1^\circ\text{C}$ ).

**3.9.** Bleeder valve, attached to the vacuum train to facilitate adjustment of the vacuum being applied to the vacuum vessel.

**3.10.** Mechanical shaker for removing air from asphalt mix with a built-in digital timer capable of 0.25 second accuracy and a maximum time limit of 99 minutes. Also must have ability to adjust vibration frequency to permit maximum release of air and a 3-point switch for off, manual or timed operation. Must have the ability to fully clamp and hold in place a Type A or Type B container full of water and asphalt mix while removing the air from the mix through the vibration process. Must be able to meet or exceed the Gilson Vibro-Deairator (SGA-5R).

**3.11.** Test equipment will be arranged as shown in **Figure 1**, except that the vacuum control can be located anywhere between the pump and the sample container; otherwise incorrect vacuum readings may occur.

Figure 1

#### 4. CALIBRATION OF FLASKS AND BOWLS

**4.1.** The mass of the Type A or Type B vacuum containers shall be calibrated in water while the water is maintained at  $77 \pm 2^\circ\text{F}$  ( $25 \pm 1^\circ\text{C}$ )<sup>1</sup>.

#### 5. PREPARING MATERIAL

**5.1.** The sample size shall conform to the requirements of **Table 1**. Samples larger than the capacity of the container may be tested a portion at a time.

---

<sup>1</sup> **AASHTO T 209** calibrates for a range of temperatures. KDOT specifies the water bath be maintained at  $77 \pm 2^\circ\text{F}$  ( $25 \pm 1^\circ\text{C}$ )

**Table 1**  
**Test Sample Size**

Nominal Maximum Aggregate Size in Mixture	Minimum Sample Size, g
2 in (50.0 mm)	6,000
1 1/2 in (37.5 mm)	4,000
1 in (25.0 mm)	2,500
3/4 in (19.0 mm)	2,000
1/2 in (12.5 mm)	1,500
3/8 in (9.5 mm)	1,000
No. 4 (4.75 mm)	500

## 6. PROCEDURE

**6.1.** If this is a design mix, then age the asphalt material by placing the sample in a preheated draft oven at compaction temperature for 2 hours as outlined in **KT-58 Section 7.5 of this manual**. Remove from the oven and permit to cool. During the cooling process, start separating the particles. Once the sample nears room temperature, separate the particles of the sample by hand, taking care to avoid fracturing the aggregate, so that the particles of the fine aggregate portion are not larger than 1/4 in (6.3 mm). If the sample is not sufficiently soft to be separated manually, place it in a flat pan, and warm it in an oven until it can be separated as described.

**NOTE:** Field samples should be retrieved from the roadway behind the paver, stored in an insulated container and returned to the laboratory. Once the sample arrives at the laboratory and the material is hot enough to separate out as outlined in **Section 6.1** of this test method, then continue with **Section 6.2** of this test method. If the sample has cooled too much, then place in a preheated draft oven at compaction temperature for 30 minutes and continue with **Section 6.1** of this test method. Do not perform the aging process as stated in **Section 6.1** of this test method.

**6.2.** Unless the sample has been prepared in a laboratory using oven-dry aggregates, oven-dry to constant mass at a temperature of  $221^{\circ} \pm 9^{\circ}\text{F}$  ( $105^{\circ} \pm 5^{\circ}\text{C}$ ). This drying and any required warming for particle separation as described in **Section 6.1** of this test method should be combined as a single operation to minimize reheating effects. Any Marshall or Superpave Gyratory plugs used must also be dried and softened in an oven (30-60 minutes).

**6.3.** Cool the sample to room temperature, place it in a tared calibrated flask or bowl. The sample is to be placed directly into a Type A or B vacuum container. A container within a container is not to be used. Weigh and designate the net mass of the sample as "A". Add sufficient water at a temperature of  $77^{\circ} \pm 2^{\circ}\text{F}$  ( $25^{\circ} \pm 1^{\circ}\text{C}$ ) to cover the sample completely.

**6.4.** Remove air trapped in the sample by applying gradually increased vacuum until the residual pressure manometer reads  $3.7 \pm 0.3 \text{ kPa}$  ( $27 \pm 3 \text{ mm of Hg}$ )<sup>2</sup>. Full vacuum shall be applied within 30 seconds. Maintain this residual pressure for  $14 \pm 0.5 \text{ min}$ . Agitate the container and contents during the vacuum period continuously using a mechanical device. Glass vessels should be taken on a resilient surface such as a rubber or plastic mat, and not on a hard surface, so as to avoid excessive impact while under vacuum.

---

<sup>2</sup> AASHTO T 209 requires a residual pressure of  $27.5 \pm 2.5 \text{ mm of Hg}$ .

**6.4.1.** The frequency on the mechanical shaker shall be set to impart a vibration that maximizes particle turbulence with minimum rotation of the material in a clockwise or counter clock wise direction. Monitor and adjust the frequency to maintain maximum particle turbulence throughout the time under vacuum.

**NOTE:** The release of entrapped air may be facilitated by the addition of a suitable wetting agent such as Aerosol OT in concentration of 0.001% or 0.2 grams in 20 L of water. This solution is then diluted by about 20:1 to make a wetting agent of which 5 to 10 mL may be added to the apparatus.

**6.5.** At the end of the vacuum period, release the vacuum by increasing the pressure at a rate not to exceed 8 kPa (60 mm of Hg) per second and proceed with one of the following determinations.

**6.5.1.** Suspend the container and contents in the water bath and determine the mass after  $10 \pm 1$  minute immersion. Measure the temperature of the water bath to verify  $77^\circ \pm 2^\circ\text{F}$  ( $25^\circ \pm 1^\circ\text{C}$ ). Designate the mass of the sample in water as “C”.

## 7. CALCULATIONS

**7.1.** Calculate the theoretical maximum specific gravity ( $G_{mm}$ ) of the sample at  $77^\circ\text{F}$  ( $25^\circ\text{C}$ ) as follows:

$$G_{mm} = A/(A-C)$$

Where:      A= Mass of dry sample in air, g  
                C= Mass of the sample in water at  $77^\circ\text{F}$  ( $25^\circ\text{C}$ ), g

**7.1.1.** When it is necessary to test a sample a portion at a time, the differences between the theoretical maximum specific gravities for each portion should be within the precision statements listed in **Section 8** of this test method. If the values are within the precision statements, the specific gravities for each portion shall be averaged. If the values are outside the precision statements, the test shall be run again.

**7.2.** Calculate the theoretical maximum specific gravity of the samples as shown on the work sheet below.

Reference				
Project	Date		Lab. No.	
Sample No.				
Mass of Container, g				
Mass of Dry Sample in air, g	A			
Mass of Vacuumed Sample in Water, g	C			
Specific Gravity (in water) = $A/(A-C)$				

## 8. PRECISION

**8.1.** Criteria for judging the acceptability of specific gravity test results obtained by this method are given in **Table 2**. The figures given in column 2 are the standard deviations that have been found to be appropriate for the conditions of test described in column 1. The figures are given in column 3 are the limits that should not be exceeded by the difference between the results of the two properly conducted tests.

**Table 2<sup>3</sup>**  
**Specific Gravity Test Results**

Type <sup>4</sup>	Standard Deviation (1S)	Acceptable Range of Two Results (D2S)
Single-operator precision	0.0051	0.014
Multilaboratory precision	0.0084	0.024

## 9. REPORTING

**9.1.** Reporting Air Voids.  $V_a$  to 0.01%.  $G_{mm}$  and  $G_{mb}$  to 0.001.

---

<sup>3</sup> **Table 2** is copied from **AASHTO T 209**.

<sup>4</sup> **AASHTO T 209** provides an additional section, **§13. SUPPLEMENTAL PROCEDURE FOR MIXTURES CONTAINING POROUS AGGREGATE**. This section is not addressed in **KT-39**.

5.9.43 MOISTURE CONTENT OF ASPHALT MIXTURES OR MINERAL AGGREGATES –  
MICROWAVE OVEN METHOD (Kansas Test Method KT-43)

## 1. SCOPE

This method describes a procedure for determining the amount of moisture present in asphalt mixtures or graded mineral aggregates used in asphalt mixtures. Use of this method is limited to asphalt mixtures containing paving grade asphalts. Use of this method with cut-back asphalts or emulsions is not authorized. **KT-43** reflects testing procedures found in **AASHTO T 255**.

## 2. REFERENCED DOCUMENTS

2.1. Part V, 5.9; Sampling and Test Methods Foreword

2.2. KT-01; Sampling and Splitting of Aggregates

2.3. KT-25; Sampling and Splitting Plant Mixed Asphalt Mixtures

2.4. AASHTO T 255; Total Evaporable Moisture Content of Aggregate by Drying

## 3. APPARATUS

3.1. The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

3.2. Microwave oven capable of holding 4000 g sample.

3.3. Sample containers must be paper, glass or ceramic.

3.4. Riffle splitter, 1 in (25 mm) wide riffles – optional.

3.5. A 1 gal (4 L) friction lid can.

## 4. SAMPLE PREPARATION

4.1. Secure a sample representative of the moisture content in the material being tested, and in the case of normal-weight aggregate, weighing not less than the amount listed in **Table 1**. Protect the sample from loss of moisture prior to weighing.

<b>Table 1</b>	
<b>Sample Size for Normal Weight Aggregate</b>	
No. 4 (4.75 mm)	0.5 kg
3/8 in (9.5 mm)	1.5 kg
1/2 in (12.5 mm)	2.0 kg
3/4 in (19.0 mm)	3.0 kg
1 in (25.0 mm)	4.0 kg

Based on sieves with square openings

To determine the minimum sample weight for lightweight aggregate, multiply the value by the approximate dry loose unit weight of the aggregate in kg/m<sup>3</sup> and divide by 1600.

## 5. TEST PROCEDURE

5.1. Place the sample in a tared sample container and weigh to the nearest 1.0 g and record the mass.

**5.2.** Place the sample in a microwave oven and turn on.

**5.3.** After 5 minutes, turn oven off, remove the sample container, weigh the sample and container to the nearest 1.0 g and record the mass.

**5.4.** Return the sample and container to the oven, turn oven on and dry the sample for an additional 5 minutes.

**5.5.** After 5 minutes, turn oven off, remove the sample container and weigh the sample container to the nearest 1.0 g and record the mass.

**5.6.** The sample is thoroughly dry when further heating causes, or would cause, less than 0.1% additional loss in weight.

**5.7.** Weigh the dried sample to the nearest 0.1% after it has cooled sufficiently not to damage the balance.

**CAUTION:** When using a microwave oven, occasionally minerals are present in aggregates which may cause the material to overheat and explode. If this occurs it can damage the microwave oven.

## **6. CALCULATIONS**

**6.1.** Calculate total moisture content as follows:

$$p = 100(W-D)/D$$

Where:            p = Moisture content of sample, percent  
                      W = Weight of original sample, g and  
                      D = Weight of dried sample, g

## 5.9.55 PLASTIC FINES IN COMBINED AGGREGATES BY USE OF THE SAND EQUIVALENT TEST (Kansas Test Method KT-55)

### **1. SCOPE**

This test is intended to serve as a rapid test to show the relative proportions of fine dust or claylike material in minus No. 4 (4.75 mm) combined aggregates. **KT-55** reflects testing procedures found in **AASHTO T 176**.

### **2. REFERENCED DOCUMENTS**

**2.1.** AASHTO T 176; Plastic Fines in Graded Aggregates and Soils by Use of the Sand Equivalent Test

### **3. APPARATUS**

**3.1.** A graduated plastic cylinder, rubber stopper, irrigator tube, weighted foot assembly and siphon assembly, all conforming to their respective specifications and dimensions described in **AASHTO T 176, Section 4.1**. Fit the siphon assembly to a 1 gal (4 L) bottle of working calcium chloride solution (see **Section 3.7** of this test method) placed on a shelf  $36 \pm 1$  in ( $915 \pm 25$  mm) above the work surface.

**3.2.** A  $3 \pm 0.2$  oz ( $85 \pm 5$  mL) tinned box approximately 2.25 in (57 mm) in diameter, with Gill style cover.

**3.3.** A wide mouth funnel approximately 4 in (100 mm) in diameter.

**3.4.** A clock or watch reading in minutes and seconds.

**3.5.** A mechanical shaker as described in **AASHTO T 176, Section 4.6**. Prior to use, fasten the mechanical sand equivalent shaker securely to a firm and level mount.

**3.6.** Stock calcium chloride solution: Prepare the stock calcium chloride solution as follows:

1 lb (454 g) technical grade Anhydrous Calcium Chloride  
2050 g (1640 mL) USP Glycerin  
47 g (45 mL) Formaldehyde (40% solution)

**3.6.1.** Dissolve the calcium chloride in 1/2 gal (1.89 L) of distilled water. Cool the solution and then filter it through Whatman No. 12 or equivalent paper. Add the glycerin and formaldehyde to the filtered solution, mix well, and dilute to 1 gal (3.78 L) with distilled water.

**3.7.** Working calcium chloride solution: Prepare the working calcium chloride by diluting  $3 \pm 0.2$  oz ( $85 \pm 5$  mL) of the stock calcium chloride solution to 1 gal (3.78 L) with water. Use distilled or demineralized water for the normal preparation of the working solution. Working solutions more than 30 days old shall be discarded.

**3.8.** A straightedge or spatula, suitable for striking off the excess material from the tin measure.

**3.9.** A thermostatically controlled drying oven capable of maintaining a temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

## **4. CONTROL**

**4.1.** Maintain the temperature of the working solution at  $72 \pm 5^{\circ}\text{F}$  ( $22 \pm 3^{\circ}\text{C}$ ) during the performance of this test. If field conditions prevent temperatures from staying within this temperature range, submit frequent referee samples to the district laboratory for comparison. Temperature correction factors can also be established for each combined aggregate being tested.

**4.2.** Perform the test in a location free of vibrations; vibrations may cause the suspended material to settle at a rate greater than normal.

**4.3.** Do not expose the plastic cylinders to direct sunlight any more than is necessary.

**4.4.** To remove organic growth from the working calcium chloride solution container and from the inside of the flexible tubing and irrigator tube, prepare a cleaning solvent by diluting sodium hypochlorite with an equal quantity of water. Fill the solution container with the prepared cleaning solvent. Allow about a liter of the cleaning solvent to flow through the siphon assembly and irrigator tube, allow to stand overnight. After soaking, allow the cleaning solvent to flow out through the siphon assembly and irrigator tube. Remove the siphon assembly from the solution container and rinse both with clear water. The irrigator tube and siphon assembly can be rinsed easily by attaching a hose between the tip of the irrigator tube and water faucet and backwashing fresh water through the tube.

**4.5.** Occasionally the holes in the tip of the irrigator tube may become clogged by a particle of sand. If the obstruction cannot be freed by any other method, use a pin or other sharp object to force it out, using extreme care not to enlarge the size of the opening.

## **5. SAMPLE PREPARATION**

**5.1.** Perform the sand equivalent test on combined aggregate materials passing the No. 4 (4.75 mm) sieve. Pulverize all aggregate of fine-grained soil materials to pass the No. 4 (4.75 mm) sieve, and clean all fines from the particles retained on the No. 4 (4.75 mm) sieve and include with the material passing the No. 4 (4.75 mm) sieve.

**5.2.** Split or quarter enough of the original sample to yield slightly more than four 3 oz (85 mL) tin measures of material passing the No. 4 (4.75 mm) sieve. Use extreme care to obtain a truly representative portion of the original sample. Dampen the material to avoid loss or segregation of the fines if necessary.

**5.3.** Prepare two test samples using the following method.

**5.3.1.** Split or quarter enough material from the portion passing the No. 4 (4.75 mm) sieve to fill the 3 oz. (85 mL) tin measure so it is slightly rounded above the brim. While filling the measure, tap the bottom edge of the tin on the work table or other hard surface to cause consolidation of the material and allow the maximum amount to be placed in the tin. Strike off the tin measure level full with a spatula or straightedge.

**5.3.2.** Dry the test sample to constant mass at  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ), cool to room temperature before testing.

## 6. PROCEDURE

**6.1. For each test sample:** Siphon  $4 \pm 0.1$  in ( $101.6 \pm 2.5$  mm) of working calcium chloride solution into the plastic cylinder. Pour the prepared test sample from the measuring tin into the plastic cylinder using the funnel to avoid spillage. Tap the bottom of the cylinder sharply on the heel of the hand several times to release air bubbles and to promote thorough wetting of the sample.

**6.2.** Allow the wetted sample to stand undisturbed for  $10 \pm 1$  minutes. At the end of the 10 minute soaking period, stopper the cylinder, then loosen the material from the bottom by partially inverting the cylinder and shaking it simultaneously.

**6.3.** After loosening the material from the bottom of the cylinder, place the stoppered cylinder in the mechanical<sup>1</sup> sand equivalent shaker and secure. Make sure the timer is set for 45 seconds then turn the shaker on.

**6.4.** Following the shaking operation, set the cylinder upright on the work surface and remove the stopper.

**6.5.** Insert the irrigator tube in the cylinder and rinse material from the cylinder walls as the irrigator is lowered. Force the irrigator through the material to the bottom of the cylinder by applying a gentle stabbing and twisting action while the working solution flows from the irrigator tip. This flushes the fine material into suspension above the coarser sand particles. Continue to apply the stabbing and twisting action while flushing the fines upward until the cylinder is filled to the 15 in (381 mm) mark. Then raise the irrigator slowly without shutting off the flow so that the liquid level is maintained at 15 in (381 mm) while the irrigator is being withdrawn. Regulate the flow just before the irrigator is entirely withdrawn and adjust the final level to 15 in (381 mm).

**6.6.** Allow the cylinder and contents to stand undisturbed for 20 minutes  $\pm 15$  seconds. Start the timing immediately after withdrawing the irrigator tube.

**6.7.** At the end of the 20-minute sedimentation period, read and record the top level of the clay suspension. This is referred to as the “clay reading”. If no clear line of demarcation has formed at the end of the specified 20-minute sedimentation period, allow the sample to stand undisturbed until a clay reading can be obtained, then immediately read and record the top level of the clay suspension and total sedimentation time. If the total sedimentation time exceeds 30 minutes, rerun the test using three individual samples of the same material. Read and record the clay column height of that sample requiring the shortest sedimentation period only.

**6.8.** Obtain the “sand reading” after the clay reading has been taken. The sand reading is determined by placing the weighted foot assembly over the cylinder and gently lowering the assembly toward the sand. Do not allow the indicator to hit the mouth of the cylinder as the assembly is being lowered. As the weighted foot comes to rest on the sand, tip the assembly toward the graduations on the cylinder until the indicator touches the inside of the cylinder. Subtract 10 in (254 mm) from the level indicated by the extreme top edge of the indicator and record this value as the sand reading.

**6.9.** If the clay or sand readings fall between the 0.1 in (2.5 mm) graduations, record the level of the higher graduation as the reading. For example, a clay reading of 7.95 in (199 mm) would be recorded as 8.0 in (200 mm), and a sand reading of 3.32 in (83 mm) would be recorded as 3.4 in (85 mm).

---

<sup>1</sup> AASHTO T 176 Section 8.4.2. and 8.4.3 provides alternative means of the sample; the Manual and Hand Method. The alternatives are not options under KT-55.

## 7. CALCULATIONS

7.1. Calculate the sand equivalent (SE) to the nearest 0.1 using the following formula:

$$SE = \frac{100(\text{Sand Reading})}{\text{Clay Reading}}$$

7.2. If the calculated sand equivalent is not a whole number, report it as the next higher whole number, as in the following example:

$$SE(\text{English}) = \frac{100(3.4)}{8} = 42.5, \text{ which is reported as } 43$$

$$SE(\text{Metric}) = \frac{100(85)}{200} = 42.5, \text{ which is reported as } 43$$

7.3. Average the whole number values determined as described above. If the average of these values is not a whole number, raise it to the next higher whole number.

## 8. REPORT

8.1. Record and report to the whole number.

## 5.9.56 RESISTANCE OF COMPACTED ASPHALT MIXTURE TO MOISTURE INDUCED DAMAGE (Kansas Test Method KT-56)

### **1. SCOPE**

This test covers preparation of specimens and measurement of the change of tensile strength resulting from the effects of saturation and accelerated water conditioning of compacted asphalt mixtures in the laboratory. **KT-56** reflects testing found in **AASHTO T 283**. The results may be used to:

1. Predict the ability of an asphalt mix to withstand long-term stripping,
2. Evaluate liquid anti-stripping additives which are added to the asphalt cement, or
3. Evaluate pulverized solids, such as hydrated lime, which are added to the mineral aggregate.

### **2. REFERENCED DOCUMENTS**

- 2.1. Part V, 5.9.; Sampling and Test Methods Foreword
- 2.2. KT-06; Specific Gravity and Absorption of Aggregate
- 2.3. KT-14; Marshall Tests of Bituminous Mixes
- 2.4. KT-15; Bulk Specific Gravity and Unit Weight of Compacted Hot Mix Asphalt (HMA)
- 2.5. KT-25; Sampling and Splitting Plant Mixed Asphalt Mixtures
- 2.6. KT-32; Method of Test for Density of Compacted Asphalt Mixtures by Nuclear Method
- 2.7. KT-39; Theoretical Maximum Specific Gravity of Asphalt Paving Mixtures
- 2.8. KT-58; Method for Preparing and Determining the Density of Hot Mix Asphalt (HMA) Specimens by Means of the Superpave Gyrotory Compactor
- 2.9. AASHTO T 283; Resistance of Compacted Asphalt Mixture to Moisture Induced Damage

### **3. APPARATUS**

- 3.1. Equipment for preparing and compacting specimens from **KT-58** of this manual.
- 3.2. Vacuum container with a minimum inside diameter of 8 in (200 mm) and an inside height capable of placing a minimum of 1 in (25 mm) of water above specimen plus base plate prior to vacuum. Vacuum container capable of withstanding a 1.2 in (30 mm) of Hg absolute pressure. Base plates to be made of perforated Polypropylene material with a minimum of 6 in (150 mm) diameter.
- 3.3. Vacuum pump or water aspirator capable of obtaining a 1.2 in (30 mm) of Hg absolute pressure. To include a manometer or vacuum gauge and appropriate hose to accommodate pressure and distance requirements.
- 3.4. The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

**3.5.** Water bath capable of maintaining a temperature of  $77 \pm 1^{\circ}\text{F}$  ( $25 \pm 0.5^{\circ}\text{C}$ ).

**3.6.** Water bath capable of maintaining a temperature of  $140 \pm 2^{\circ}\text{F}$  ( $60 \pm 1^{\circ}\text{C}$ ).

**3.7.** Freezer maintained at  $0 \pm 10^{\circ}\text{F}$  ( $-18 \pm 5^{\circ}\text{C}$ ).

**3.7.1.** Freezer operation should be checked every 6 months by determining the high and low temperatures reached during compressor cycles. A thermal mass (thermometer well) may be used to reduce temperature fluctuation during compressor cycles. A 2" x 2" x 3.75" (50 mm x 50 mm x 95 mm) aluminum block, drilled at one end to receive a thermocouple, will adequately dampen temperature swings.

**3.8.** A supply of plastic film for wrapping, heavy-duty leak proof plastic bags to enclose the saturated specimens and masking tape.

**3.9.** 10 mL graduated cylinder.

**3.10.** Loading jack and ring dynamometer from **KT-14** of this manual to provide controlled vertical deformation at the rate of 2 in (50.8 mm) per minute.

**3.11.** Breaking head will consist of stainless steel loading strips with a concave surface having a radius of curvature equal to the nominal radius of the test specimen. For specimens 4 in (102 mm) in diameter the loading strips are to be 0.5 in (12.7 mm) wide, and for specimens 6 in (150 mm) in diameter the loading strips are to be 0.75 in (19.05 mm) wide. The length to thickness ratio of the loading strips is to exceed one. Round the edge of the loading strips.

**3.12.** Pans having a surface area of 75-100 square inches (48,400-64,500 square millimeters) in the bottom and a depth of approximately 1 in (25 mm).

**3.13.** Forced air draft oven, thermostatically controlled, capable of maintaining any desired temperature setting from room temperature to  $350^{\circ} \pm 5^{\circ}\text{F}$  ( $176^{\circ} \pm 3^{\circ}\text{C}$ ).

#### **4. PREPARATION OF LABORATORY TEST SPECIMENS**

**4.1.** Use specimens that are 6 in (150 mm) in diameter and  $3.75 \pm 0.20$  in ( $95 \pm 5$  mm) thick.

**4.2.** Build the aggregate material in the same manner as described in **KT-14 Sections e.2.b. or e.2.c.** of this manual. A minimum of six specimens will be required to perform this test. The asphalt quantity is based on the optimum design content. Additional material for **KT-39** of this manual may be required.

**4.3.** Preparation of mixes: Combine individual aggregates or reclaimed material and virgin aggregates by weighing out in a separate pan for each test specimen, proportionate amounts of each size fraction for each individual aggregate to produce the desired combined gradation. The combined aggregate should be sufficient to produce a compacted specimen as described in **Section 4.1.**

**4.4.** Heat the aggregate and asphalt within the limits of mixing temperature determined in **KT-14 Section d.1.** of this manual. Charge the mixing bowl with the heated aggregate and form a crater in the top. Add the required amount of asphalt and mix the aggregate and asphalt until thoroughly coated, at least 2 minutes. Care should be taken to keep the entire sample in the mixing bowl during this process.

**4.5.** Either prior to, or after compaction, permit the mix to age at room temperature for  $24 \pm 1$  hours before continuing to **Section 6** of this test method.

**4.6.** Place the mixture in an oven set at the appropriate compaction temperature and age the material for 2 hours as outlined in **KT-58 7.5<sup>1</sup>** of this manual. Compact the mixture to  $7.0 \pm 0.5$  % air voids. This level of voids can be obtained by adjusting the specimen mass or the height in **Sect. 4.1.** of this test method. The exact procedure must be determined experimentally for each mixture before compaction the specimens for each set.

**4.7.** Extract the specimens from the molds and allow cooling to room temperature. Due to the elevated void content and potential instability of the specimens, verify that each specimen is adequately cool and stable prior to removal from the mold.

## **5. PREPARATION OF FIELD TEST SPECIMENS**

**5.1.** Select locations on the completed pavement to be sampled as outlined in **KT-25** of this manual.

**5.2.** Place the field mixture in an oven set at the appropriate compaction temperature. Do not age the field mixture in the oven. Compact the field mixture as outlined in **KT-58** of this manual beginning at **Sect. 7.7.** Compact the mixture to  $7.0 \pm 0.5$  % air voids. This level of voids can be obtained by adjusting the specimen mass or the height in **Sect. 4.1.** of this method. The exact procedure must be determined experimentally for each mixture before compaction the specimens for each set.

**5.3.** Do not age for 24 hours as stated in **Sect. 4.5.**

## **6. EVALUATION OF TEST SPECIMEN AND GROUPING**

**6.1.** Determine the theoretical maximum specific gravity of mixture by **KT-39** of this manual.

**6.2.** Determine the specimen thickness, to the nearest 0.001 in (0.01 mm), at approximately quarter points on the periphery. Average the results and record. For height, a specimen measuring device can also be used in lieu of averaging. Also determine the diameter to the nearest 0.001 in (0.01 mm).

**6.3.** Determine the bulk specific gravity by **KT-15**, Procedure III of this manual. Express volume of specimens in mL.

**6.4.** Calculate air voids by using the following formula:

$$\% \text{ Air Voids} = \frac{100(\text{Theoretical Max. S.G.} - \text{Bulk S.G.})}{\text{Theoretical Max. S.G.}}$$

**6.5.** Sort specimens into two subsets of three specimens each so the average air voids of the two subsets are as equal as mathematically possible.

## **7. PRECONDITIONING OF TEST SPECIMENS**

**7.1.** Test one subset dry and test the other subset after preconditioning.

---

<sup>1</sup> **AASHTO T 283 Section 6.34** requires the material to be cooled at room temperature for  $2 \pm 0.5$  h then placed in an oven at  $60 \pm 3^\circ\text{C}$  for 16 hours prior to curing.

**7.2.** Store the dry subset at room temperature until testing. Measure the height and diameter of the dry set. Wrap the specimens with plastic, heavy duty leak proof plastic bag or place in plastic concrete cylinder molds<sup>2</sup>. Place the specimens in the  $77 \pm 1^\circ\text{F}$  ( $25 \pm 0.5^\circ\text{C}$ ) water bath for 2 hours  $\pm$  10 minutes and then test as described in **Section 8** of this test method.

**7.3.** Condition the other subset as follows:

**7.3.1.** Place the specimen in the vacuum container supported by a base plate positioned above the container bottom. Fill the container with potable water at room temperature so that the specimens have at least 1 in (25 mm) of water above their surface. Apply partial vacuum (10 to 26 in [250 to 650 mm] of Hg) for a short time (5 to 10 minutes). These are only estimates for vacuum and time. Remove the vacuum and leave the specimens submerged in water for a short time (5 to 10 minutes).

**7.3.2.** Determine bulk specific gravity of the three conditioned samples by **KT-15**, Procedure I of this manual with noted exception in **Section 6.3** of this test method. Prior to placing the sample in the water bucket, place a sheet of plastic wrap on the balance and zero the balance. Within two minutes of taking the sample from the water bucket, determine the SSD mass of the sample, calculate the degree of saturation, and determine if the degree of saturation is acceptable as shown in **Section 7.3.3** of this test method. If the degree of saturation is acceptable, wrap the samples with the plastic wrap. All moisture draining from the plug during this process is to be collected by the plastic wrap and is not permitted to be discarded. Compare saturated surface dry mass with dry mass determined in **Section 6.3** of this test method. Calculate volume of absorbed water.

**7.3.3.** Determine degree of saturation by comparing volume of absorbed water with volume of air voids from **Section 6.4** of this test method. If the volume of water is between 70 to 80% of the volume of air, proceed to **Section 7.3.4**. If volume of water is less than 70%, repeat the procedure beginning with **Section 7.3.1** of this test method using more vacuum and/or time. If volume of water is more than 80%, specimen has been damaged and is discarded. Using a new specimen repeat the procedure using less vacuum and/or time.

**7.3.4.** Cover the vacuum saturated specimens tightly with a second layer of plastic wrap. Place each wrapped specimen in a plastic bag containing 10 mL of water and seal the bag.

**7.3.5.** Within 2 minutes, place the plastic bag containing the specimens in a freezer at  $0 \pm 10^\circ\text{F}$  ( $-18 \pm 5^\circ\text{C}$ ) for a minimum of 16 hours.

**7.3.6.** After removal from the freezer, place the specimens into a  $140 \pm 2^\circ\text{F}$  ( $60 \pm 1^\circ\text{C}$ ) water bath for  $24 \pm 1$  hours. Remove the plastic bag and film from the specimens as soon as possible after placement in the water bath.

**7.3.7.** After  $24 \pm 1$  hours in the  $140 \pm 2^\circ\text{F}$  ( $60 \pm 1^\circ\text{C}$ ) water bath, remove the specimens and place them in a water bath already at  $77 \pm 1^\circ\text{F}$  ( $25 \pm 0.5^\circ\text{C}$ ) for 2 hours  $\pm$  10 minutes. It may be necessary to add ice to the water bath to prevent the water temperature from rising above  $77 \pm 1^\circ\text{F}$  ( $25 \pm 0.5^\circ\text{C}$ ). Not more than 15 minutes should be required for the water bath to reach  $77 \pm 1^\circ\text{F}$  ( $25 \pm 0.5^\circ\text{C}$ ).

**7.3.8.** Remove the conditioned plugs from the water bath. Quickly damp dry the saturated specimen with a damp absorbent cloth and weigh the specimen. Any water which seeps from the specimen during the weighing operation is considered part of the saturated specimen. Place the specimen in the basket or

---

<sup>2</sup> Concrete cylinder molds have found to successfully keep the plugs from becoming saturated. Care must be taken so the lid is fitted properly thus keeping the plugs dry.

bucket and determine the mass to the nearest 0.5 g while immersed in water at  $77 \pm 1^\circ\text{F}$  ( $25 \pm 0.5^\circ\text{C}$ ). The mass of the specimen in water shall be determined as quickly as possible after the specimen is immersed.

**7.3.9.** Determine the height and diameter of the specimen prior to testing.

## **8. TESTING**

**8.1.** Determine the indirect tensile strength of dry and conditioned specimens at  $77 \pm 1^\circ\text{F}$  ( $25 \pm 0.5^\circ\text{C}$ ).

**8.1.1.** Place the specimens between the two bearing plates in the testing machine. Care must be taken so that the load will be applied along the diameter of the specimen. Apply the load to the specimens by means of the constant rate of movement of the testing head of 2 in (50.8 mm) per minute.

**8.1.2.** Record the maximum compressive strength noted on the testing machine, and maintain continuous loading until a vertical crack appears. Remove the specimen from the machine and pull apart at the crack. Inspect the interior surface for stripping and record the observations.

## **9. CALCULATIONS**

**9.1.** Calculate the tensile strength as follows:

$$S_t \text{ (English)} = \frac{2(P)}{\pi (t)(D)}$$

$$S_t \text{ (Metric)} = \frac{2000(P)}{\pi (t)(D)}$$

Where:

- $S_t$ = Tensile strength, psi (kPa)
- $P$ = Maximum load, lbf (N)
- $t$ = Specimen thickness, in (mm)
- $t''$ = Conditioned specimen thickness, in (mm)
- $D$ = Specimen diameter, in (mm), and
- $D''$ = Conditioned specimen diameter, in (mm)

( $D''$  and  $t''$  replace  $D$  and  $t$  when calculating the conditioned specimen's tensile strength)

**9.2.** Express the numerical index or resistance of asphalt mixtures to the detrimental effect of water as the ratio of the original strength that is retained after the freeze-warm water conditioning.

Calculate as follows:

$$\% \text{ Tensile Strength Ratio (\%TSR)} = \frac{100(S_2)}{S_1}$$

Where:

- $S_1$ = Average tensile strength of dry subset, and
- $S_2$ = Average tensile strength of conditioned subset

**NOTE:** If an anti-stripping agent is used, include the agent in all asphalt mixtures for the conditioned and unconditioned subsets.

## 10. ADDITIVES

**10.1.** If additives are found to be necessary, return to **Section 4** of this test method and proceed through the test procedure. If lime is proposed, add to the aggregate portion during **Section 4.3** of this test method. If liquid anti-strip agents are proposed, add to the asphalt material prior to **Section 4** of this test method. The contractor will supply the lime or liquid anti-strip agent along with the quantity and method to be used on the project. Use the proposed quantity and method during the test procedure to determine the effectiveness of additives on the bituminous mixture.

## 11. ESTABLISHING OUTLIERS IN A SUBSET OF PLUGS

**11.1.** The “T” Statistic test, as presented in **KT-32** of this manual, represents a method to statistically analyze a subset for the potential of having an outlier. It requires the calculation of the mean, sample standard deviation and for the subset values to be oriented in an ascending order. Do not determine if there is an outlier, as described in this section, when the range (difference between highest and lowest value) of the three plugs do not exceed 11 psi (75 kPa). The following two examples illustrate how the “T” Statistic would be used to analyze a subset of conditioned plugs.

### *“T” Statistic Analysis of a Conditioned subset of plugs:*

EXAMPLE 1: Subset passing the “T” Statistic Test Conditioned subset plugs strengths:

1 – 430 kPa

2 – 419 kPa

3 – 495 kPa

$d_1 = 419$  kPa

$d_b = 448$  kPa

$d_n = 495$  kPa

$T_{0.95} = 1.15$

$S = 41.1$  kPa

$$T_l = \frac{d_b - d_1}{S}$$

$$= \frac{448 - 419}{41.1}$$

$$= 0.71$$

$$T_n = \frac{d_n - d_b}{S}$$

$$= \frac{495 - 448}{41.1}$$

$$= 1.14$$

Where:

$d_1$  = The lowest strength plug in the subset

$d_b$  = The mean (average) of the subset

$d_n$  = The highest strength plug in the subset

$S$  = The sample standard deviation (n-1) of the subset

$T_{0.95}$  = The “T” Statistic value when n=3

$T_l$  = The lower “T” value calculated from the subset

$T_n$  = The upper “T” value calculated from the subset

Since  $T_{0.95}$  (1.15) is greater than both  $T_1$  (0.71) and  $T_n$  (1.14) then there is no outlier within the subset of plugs.

#### EXAMPLE 2: Subset Failing the “T” Statistic Test

If  $d_n = 530$  kPa (instead of 495 kPa), then  $d_b = 460$  kPa,  $S = 61.2$  kPa,  $T_u = 0.67$  and  $T_n = 1.14$ . This would cause the highest strength plug ( $d_n$ ) to be classified as an outlier and would therefore be discarded. The two remaining plugs would be used to determine the average tensile strength for the subset (average subset strength =  $(419 + 430)/2 = 424$  kPa).

## 12. Report

**12.1.** Record the TSR to the nearest 0.1% Report the TSR to the nearest 1%.

### ADDENDUM TO KT-56 FOR INCLUDING LIME AS AN ANTISTRIPPING AGENT

The following information provides **KT-56** with steps to incorporate hydrated lime as an antistriping agent.

Delete **sections 4.3 and 4.4** of this test method and replace with the following:

**4.3.** Preparation of mixes: combine the virgin aggregates by weighing in a separate pan for each test specimen, proportionate amounts of each size fraction for each individual aggregate to produce the desired combined aggregate with a batch mass of approximately 1,125 g. Include the hydrated lime mass required to meet the specified percent of lime for the project as part of the total batch mass. The total aggregate mass should include lime, virgin aggregate and reclaimed material (if applicable). The total aggregate should be sufficient to produce a compacted specimen as described in **Section 4.1** of this test method.

**4.3.1.** Determine the SSD condition (**KT-06**) for the combined aggregate gradation. Add three percent of moisture to the percent moisture required to reach the SSD condition of the combined aggregate.

**4.3.2.** Place the combined virgin aggregate and hydrated lime in a mixing bowl. Carefully mix until the hydrated lime is combined with the aggregate. Add the appropriate water content, as determined in **Section 4.3.1** of this addendum to the test method, and thoroughly mix.

**4.3.3.** Oven dry the aggregate mix at  $230 \pm 9^\circ\text{F}$  ( $110 \pm 5^\circ\text{C}$ ) to a constant mass.

**4.4.** Combine the virgin aggregate material with the reclaimed material, if applicable, and thoroughly mix. Heat the combined aggregate and asphalt within limits of the mixing temperature determined in **KT-14, Section d.1.**, of this manual. Charge the mixing bowl with the heated aggregate and form a crater in the top. Add the required amount of asphalt and mix the aggregate and asphalt until thoroughly coated, at least 2 minutes. Care should be taken to keep the entire sample in the mixing bowl during this process.

5.9.57 DETERMINATION OF ASPHALT CONTENT AND GRADATION OF HOT MIX ASPHALT  
CONCRETE BY THE IGNITION METHOD (Kansas Test Method KT-57)

**1. SCOPE**

- 1.1.** This test method covers the determination of asphalt content of hot mix paving mixtures by ignition of the asphalt cement at 932°F (500°C) in a furnace. The aggregate remaining after burning can be used for sieve analysis using **KT-34**.
- 1.2.** The values in metric units are to be regarded as the standard.

**2. REFERENCED DOCUMENTS**

- 2.1.** Part V, 5.9; Sampling and Test Methods Foreword
- 2.2.** KT-01; Sampling and Splitting of Aggregates
- 2.3.** KT-25; Sampling and Splitting Plant Mixed Asphalt Mixtures
- 2.4.** KT-26; Sampling Asphalt Materials
- 2.5.** KT-34; Sieve Analysis of Extracted Aggregate
- 2.6.** AASHTO T 308; Determining the Asphalt Binder Content of Hot-Mix Asphalt (HMA) by the Ignition Method
- 2.7.** Ignition Oven Manufacturer's instruction manual

**3. SUMMARY OF TEST METHODS**

- 3.1.** The asphalt cement in the paving mixture is ignited using the furnace equipment applicable to the particular method. The asphalt content is calculated as the difference between the initial mass of the asphalt paving mixture and the mass of the residual aggregate, and the calibration factor. The asphalt content is expressed as mass percent.

**4. SIGNIFICANCE AND USE**

- 4.1.** This method can be used for quantitative determinations of asphalt binder content and gradation in hot-mixed paving mixtures and pavement samples for quality control, specification acceptance and mixture evaluation studies. This method does not require the use of solvents. Aggregate obtained by this test method may be used for sieve analysis according to **KT-34**.

**5. SAMPLING**

- 5.1.** Obtain samples of aggregate in accordance with **KT-01**.
- 5.2.** Obtain samples of freshly produced hot-mix asphalt in accordance with **KT-25**. Quarter the larger sample in the following manner:
- 5.2.1.** Spread a sheet of paper (Kraft or similar) on a hard, clean, smooth and level surface. Place the sample in a pile near the center of the paper and mix by alternately lifting each corner towards the

opposite corner thereby rolling the mixture to the opposite corner. This should be performed in a vigorous manner. Placing the sample on a piece of cardboard and mixing thoroughly with a trowel is an acceptable alternate.

**5.2.2.** Divide the pile into four equal quarters with a straightedge (trowel or similar metal blade) and completely remove two pre-selected diagonally opposite quarters.

**5.2.3.** Continue this quartering procedure until the original sample is reduced to the approximately desired size. On the final quartering step, if the sample is too large before quartering, but will be too small after quartering, the sample pile is divided into equal opposite sectors but unequal adjacent sectors. This can be accomplished by varying the dividing angle at the center of the sample pile from the normal 90 degrees. Opposite sections can then be selected to obtain the desired sample size.

**5.3.** Obtain samples of asphalt cement in accordance of **KT-26**.

**5.4.** Preparation of Test Specimens:

**5.4.1.** Place the sample in a larger flat pan and warm to  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ) for a minimum of 30 minutes or until the sample is dried to a constant mass.

**5.4.2.** The size of the test sample shall be governed by the nominal maximum aggregate size of the mixture and shall conform to the mass requirement shown in **Table 1**. When the mass of the test specimen exceeds the capacity of the equipment used, the test specimen may be divided into a suitable increments, tested and the results appropriately combined for calculation of the asphalt content (weighted average).

**Table 1**

Nominal Max. Agg. Size, in (mm)	Mass of Specimen, g
#4 (4.75)	1200 minimum
3/8 (9.5)	1200-1600
1/2 (12.5)	1500-1900
3/4 (19.0)	2000-2400
1 (25.0)	3000-3400
1 1/2 (37.5)	4000-4400
RAP	2000-2400
RAS	200-300

**NOTE:** Nominal maximum aggregate size is one size larger than the first sieve to retain more than 10%.

## **6. CALIBRATION**

**6.1.** This method may be affected by the type of aggregate in the mixture. Accordingly, to optimize accuracy, a calibration factor will be established by testing a set of calibration samples for each mix type. This procedure must be performed before any acceptance testing is completed.

**6.2.** The calibration should be repeated each time there is a change in the mix ingredients or design.

**6.3.** According to the requirements of **Section 5** of this test method, prepare two calibration samples at the design asphalt content. Prior to mixing, prepare a butter mix at the design asphalt content. The purpose of the butter mix is to condition the mixing bowl by providing a coating of asphalt and fines in the bowl. Mix and discard the butter mix prior to mixing any of the calibration specimens to ensure accurate asphalt content. Aggregate used for the calibration specimens shall be sampled from stockpiled material produced in the current construction season and designated to be used on the candidate project. In other words, this calibration process should not be completed until all necessary material has arrived on the project site. An additional “blank” specimen shall be batched and tested for aggregate gradation according to **KT-34**. The wash gradation shall fall within the mix design tolerances.

**6.4.** The freshly mixed specimens may be placed directly in the sample baskets. Allow the sample to cool to room temperature.

**6.5.** Test specimens in accordance with **Sections 7 and 8** of this test method (Test Method A) or **Sections 9 and 10** of this test method (Test Method B).

**6.6.** Perform a gradation analysis on the residual aggregate as indicated in **Section 11** of this test method. Compare the gradation to the gradation of the unburned, “blank” specimen to evaluate the amount of aggregate breakdown. *This evaluation is for information only.*

**6.7.** Once all of the calibration specimens have been burned determine the measured asphalt contents for each sample by calculation.

**6.8.** If the difference between the measured asphalt contents of the two samples exceeds 0.15%, repeat the two tests and from the four tests, discard the high and low result. Determine the calibration factor ( $C_F$ ) from the two remaining results ( $C_A$  and  $C_B$ ). Calculate the difference between the measured and actual asphalt contents for each sample. The calibration is the average of the differences expressed in percent by mass of the asphalt mixture for the Superpave designs and expressed in percent by mass of the remaining aggregate for Marshall Designs.

**Note:** Calibration factors ( $C_F$ ) cannot be less than zero. If a calibration factor is calculated to be less than zero record the calibration factor as zero.

## **7. APPARATUS (TEST METHOD A)**

**7.1.** A forced air ignition furnace, capable of maintaining the temperature at 1072°F (578°C), with an internal balance thermally isolated from the furnace chamber accurate to 0.1 g. The balance shall be capable of weighing a 3500 g sample in addition to the sample baskets. A data collection system will be included so that the mass can be automatically determined and displayed during the test. The furnace shall have a built in computer program to calculate change in mass of the sample baskets and provide for the input of a correction factor for aggregate loss. The furnace shall provide a printed ticket with the initial specimen mass, specimen mass loss, temperature compensation, correction factor, corrected asphalt binder content (percent), test time, and test temperature. The furnace chamber dimensions shall be adequate to accommodate sample size of 3500 g. The furnace shall provide an audible alarm and indicator light when the sample mass loss does not exceed 0.01% of the total sample mass for three consecutive minutes. The furnace door shall be equipped so that the door cannot be opened during the ignition test. A method for reducing furnace emissions shall be provided. The furnace shall be vented into a hood or to the outside and when set up properly shall have no noticeable odors escaping into the laboratory. The furnace shall have a fan with capacity to pull air through the furnace to expedite the test and to reduce the escape of smoke into the laboratory.

**NOTE:** The furnace shall also allow the operator to change the ending mass loss percentage to 0.02%.

**7.2.** Sample basket(s) of appropriate size that allows the samples to be thinly spread and allows air to flow up through and around the sample particles. Sets with two or more baskets shall be nested. The sample shall be completely enclosed with screen mesh or perforated stainless steel plate or other suitable material.

**NOTE:** Screen mesh or other suitable material openings of approximately No. 8 (2.36 mm) and No. 30 (600  $\mu$ m) has been found to perform well.

**7.3.** Catch pan of sufficient size to hold the sample basket(s) so that aggregate particles and melting asphalt binder falling through the screen mesh are caught.

**7.4.** Oven capable of maintaining  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**7.5.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

**7.6.** Safety equipment - safety glasses or face shield, high temperature gloves, long sleeve jacket, a heat resistant surface capable of withstanding  $1202^{\circ}\text{F}$  ( $650^{\circ}\text{C}$ ) and a protective cage capable of surrounding the sample baskets during the cooling period.

**7.7.** Miscellaneous equipment consisting of a pan larger than the sample basket(s) for transferring sample after ignition, spatulas, bowls and wire brushes.

## **8. TEST PROCEDURES (TEST METHOD A)**

**8.1.** Preheat the ignition furnace to  $932^{\circ}\text{F}$  ( $500^{\circ}\text{C}$ ). Manually record the furnace temperature (set point) prior to the initiation of the test if the furnace does not record automatically.

**8.2.** Oven dry field HMA samples to a constant mass at a temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**8.3.** Enter the calibration factor for the specific mix to be tested in the ignition furnace as determined by **Section 6** of this test method.

**8.4.** Weigh and record the mass of the sample basket(s) and catch pan (with guards in place).

**8.5.** Prepare the sample as described in **Section 5** of this test method. Record the initial mass while at room temperature. Evenly distribute this sample in the sample basket(s) that have been placed in the catch pan, taking care to keep the material away from the edges of the basket. Use a spatula or trowel to level the specimen.

**8.6.** Weigh and record the total mass of the sample, basket(s), catch pan and basket guards. Calculate and record the initial mass of the specimen (total mass minus the mass of the specimen basket assembly).

**8.7.** Input the initial mass of the specimen in whole grams into the ignition furnace controller. Verify that the correct mass has been entered.

**8.8.** Open the chamber door and place the sample baskets in the furnace. Close the chamber door and verify that the sample mass [including the basket(s)] displayed on the furnace scale equals the total mass

recorded in **Section 8.5** of this test method within  $\pm 5$  g. Differences greater than 5 g or failure of the furnace scale to stabilize may indicate that the sample basket(s) are contacting the furnace wall. Initiate the test by pressing the start/stop button. This will lock the sample chamber and start the combustion blower.

**NOTE:** The furnace temperature will drop below the set point when the door is opened, but will recover when the door is closed and ignition occurs. Sample ignition typically increases the temperature well above the set point, depending on sample size and asphalt content.

**8.9.** Allow the test to continue until the stable light and audible stable indicator indicate the test is complete (the change in mass does not exceed 0.01% for three consecutive minutes). Press the start/stop button. This will unlock the sample chamber and cause the printer to print out the test results.

**8.10.** Open the chamber door, remove the sample basket(s) and allow them to cool to room temperature (approximately 30 minutes).

**8.11.** Once the sample has cooled to room temperature, weigh and record the final mass. Calculate the uncorrected asphalt content, then apply correction factor to determine corrected asphalt content.

## **9. APPARTUS (TEST METHOD B)**

**9.1.** A forced air ignition furnace, capable of maintaining the temperature at 1072°F (578°C). The furnace chamber dimensions shall be adequate to accommodate a sample size of 3500 g sample. The furnace door shall be equipped so that the door cannot be opened during the ignition test. A method for reducing furnace emissions shall be provided. The furnace shall be vented into a hood or to the outside and when set up properly shall have no noticeable odors escaping into the laboratory. The furnace shall have a fan with capacity to pull air through the furnace to expedite the test and to reduce the escape of smoke into the laboratory.

**9.2.** Sample basket(s) of appropriate size that allows the samples to be thinly spread and allows air to flow up through and around the sample particles. Sets with two or more baskets shall be nested. The sample shall be completely enclosed with screen mesh or perforated stainless steel plate or other suitable material.

**NOTE:** Screen mesh or other suitable material openings of approximately No. 8 (2.36 mm) and No. 30 (600  $\mu$ m) has been found to perform well.

**9.3.** Catch pan of sufficient size to hold the sample basket(s) so that aggregate particles and melting asphalt binder falling through the screen mesh are caught.

**9.4.** Oven capable of maintaining  $230 \pm 9^\circ\text{F}$  ( $110 \pm 5^\circ\text{C}$ ).

**9.5.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

**9.6.** Safety equipment - safety glasses or face shield, high temperature gloves, long sleeve jacket, a heat resistant surface capable of withstanding 1202°F (650°C) and a protective cage capable of surrounding the sample baskets during the cooling period.

9.7. Miscellaneous equipment consisting of, a pan larger than the sample basket(s) for transferring sample after ignition, spatulas, bowls and wire brushes.

## 10. TEST PROCEDURES (TEST METHOD B)

10.1. Preheat the ignition furnace to 932°F (500°C).

10.2. Oven dry field HMA samples to a constant mass at a temperature of  $230 \pm 9^\circ\text{F}$  ( $110 \pm 5^\circ\text{C}$ ).

10.3. Record the calibration factor for the specific mix to be tested as determined in **Section 6** of this test method.

10.4. Weigh and record the mass of the sample basket(s) and catch pan (with guards in place).

10.5. Prepare the sample as described in **Section 5** of this test method. Place the sample basket(s) in the catch pan. Evenly distribute the sample in the basket(s), taking care to keep the material away from the edges.

10.6. Allow the sample to cool to room temperature. Weigh and record the total mass of the sample, basket(s), catch pan, basket guards. Calculate and record the initial mass of the specimen (total mass minus the mass of the specimen basket assembly).

10.7. Burn the HMA sample in the furnace for at least 40 minutes after the ignition oven has cycled through the initial burn off phase.

**NOTE:** The appropriate time for the initial burn of an HMA sample is dependent on sample size and aggregate material. For larger samples, the time could be significantly longer than 40 minutes.

10.8. Remove the sample from the furnace after ignition and allow to cool to approximately room temperature (at least 30 minutes).

10.9. Weigh and record the mass ( $W_A$ ) of the sample after ignition to the nearest 0.1 g.

10.10. Repeat steps in **Sections 10.7 (exception: adjust burn time to 10 minutes)** through **10.9** of this manual until a visual inspection indicates complete burn-off has been accomplished. The material will appear free of asphalt (no small black asphalt particles intermixed in material) and the change in measured mass ( $W_A$ ) does not exceed 0.01% of the initial mass ( $W_S$ ).

It is desirable to accomplish complete burn-off in one sequence. Adjust the 40 minute burn time to achieve this requirement. Additional burn time may indicate a need for a new filter. Filters have been found to last two to four burn-offs.

10.11. Record the last value obtained for ( $W_A$ ) as the mass ( $W_A$ ) of the sample after ignition.

10.12. Calculate the asphalt content of the sample using one of the following equations:

**10.12.1.** For a Superpave design (total mass mix):

$$AC\% = \left[ \frac{(W_S - W_A)}{W_S} \times 100 \right] - C_F$$

Where: AC% = The measured (corrected) asphalt content percent by mass of the HMA sample.  
W<sub>A</sub> = The total mass of aggregate remaining after ignition.  
W<sub>S</sub> = The total mass of the HMA sample prior to ignition  
C<sub>F</sub> = Calibration factor, percent of mass of HMA sample

Where: C<sub>F</sub> = (C<sub>A</sub> + C<sub>B</sub>)/2

C<sub>A</sub> or C<sub>B</sub> = measured asphalt content – actual content

Where:

C<sub>A</sub> or C<sub>B</sub> = Individual sample correction factors, percent by mass of HMA sample as outlined in **Section 6.8** of this test method.

**10.12.2.** For a Marshall mix design (dry aggregate method):

$$AC\% = \left[ \frac{(W_S - W_A)}{W_A} \times 100 \right] - C_F$$

Where: AC% = The measured (corrected) asphalt content percent by dry aggregate mass of the HMA sample.

## **11. GRADATION**

**11.1.** Allow the specimen to cool to room temperature in the sample baskets.

**11.2.** Empty the contents of the baskets into a flat pan. Use a small wire sieve brush to so that any residual fines are removed from the baskets.

**11.3.** Perform the gradation analysis according to **KT-34**

## **12. REPORT**

**12.1.** Always report the test method (A or B), correct asphalt content, calibration factor, temperature compensation factor (if applicable), total percent loss, sample mass, test temperature and total time. Examples of a spreadsheet available for use with Method B are in **Figure 1** and **Figure 2**.

## **13. PRECISION AND BIAS**

**13.1.** The precision estimates in Table 2 are taken from AASHTO T-308.

**NOTE:** The precision estimates given in Table 2 are based on the analysis of test results from three pairs of AASHTO Resource proficiency samples. The data analyzed consisted of results from 353 to 461 laboratories for each of the three pairs of samples. The analysis included two binder grades: PG 52-34 and

PG 64-22. Average results for asphalt content ranged from 4.049 to 5.098 percent. The details of this analysis are in NCHRP Final Report, NCHRP Project No. 9-26, Phase 3.

**NOTE:** The precision estimates are based on 4 aggregate types, 4 replicates, and 12 laboratories participating with 0 laboratory results deleted as outlying observation. All 4 aggregates were tested in surface mixes and had relatively low absorption values.

**Table 2**  
**Precision Statement**

Asphalt Content	Standard Deviation 1s	Acceptable Range of Two Results, d2s
Single Operator Precision Asphalt Content (%)	0.069	0.196
Multi Lab Precision Asphalt Content (%)	0.117	0.330

**13.2.** Any biases inherent to the ignition oven process used for Test Methods A and B, when testing for asphalt content and aggregate gradation, are accounted for by the determination and application of appropriate correction factors.

**5.9.58 METHOD FOR PREPARING AND DETERMINING THE DENSITY OF HOT MIX ASPHALT (HMA) SPECIMENS BY MEANS OF THE SUPERPAVE GYRATORY COMPACTOR (Kansas Test Method KT-58)**

**1. SCOPE**

**1.1.** This method covers the compaction of cylindrical specimens of hot mix asphalt (HMA) using the Superpave Gyratory Compactor.

**1.2.** The values stated in SI units are to be regarded as the standard.

**2. REFERENCED DOCUMENTS**

**2.1.** Part V, 5.9; Sampling and Test Methods Foreword

**2.2.** KT-06; Specific Gravity and Absorption of Aggregates

**2.3.** KT-15; Bulk Specific Gravity and Unit Weight of Compacted Hot Mix Asphalt (HMA)

**2.4.** KT-39; Theoretical Maximum Specific Gravity of Asphalt Paving Mixtures

**2.5.** AASHTO T 312; Preparing and Determining the Density of Hot Mix Asphalt (HMA) Specimens by Means of the Superpave Gyratory Compactor

**2.6.** ASTM D4402; Test Method for Viscosity Determinations of Asphalt at Elevated Temperatures Using Rotational Viscometer

**2.7.** ANSI/ASME B46.1; Surface Texture (Surface Roughness, Waviness and Lay)

**3. SIGNIFICANCE AND USE**

**3.1.** This standard is used to prepare specimens for determining the mechanical and volumetric properties of HMA. The specimens simulate the density, aggregate orientation and structural characteristics obtained in the actual roadway when proper construction procedure is used in the placement of the paving mix.

**3.2.** This test method may be used to monitor the density or test specimens during their preparation. It may also be used for field control of an HMA production process.

**4. APPARATUS**

**4.1.** Superpave Gyratory Compactor, an electro hydraulic or electromechanical compactor, with a ram and ram heads as described in **Section 4.3** of this test method that are restrained from revolving during compaction. The axis of the ram shall be perpendicular to the platen of the compactor. The ram shall apply and maintain a pressure of  $600 \pm 18$  kPa to a specimen cross section during compaction. The compactor shall tilt specimen molds at an internal angle of  $1.16 \pm 0.02$  degrees and gyrate specimen molds at a rate of  $30.0 \pm 0.5$  gyrations per minute throughout compaction. The compactor shall be designed to permit the specimen mold to revolve freely on its tilted axis during gyration.

**NOTE:** This stress calculates to  $10,600 \pm 106$  N total force for 150 mm specimens.

**4.1.1.** Specimen height measurement and recording device, when specimen density is to be monitored during compaction, a means shall be provided to continuously measure and record the height of the specimen to the nearest 0.1 mm during compaction once per gyration.

**4.1.2.** The built-in reporting system shall include a printer connected to a port capable of printing test information. The information shall include specimen height per gyration. The system should include a computer and suitable software for data acquisition and reporting.

**4.2.** Specimen molds shall have steel walls that are at least 0.30 in (7.5 mm) thick and are hardened to at least Rockwell C 48. The inside finish of the molds shall have a root mean square (rms) of 1.60  $\mu\text{m}$  or smoother. Molds shall have an initial inside diameter of 5.902 to 5.906 in (149.90 to 150.00 mm) and at least 10 in (250 mm) high. Molds with an inside diameter of greater than 150.20 mm shall be removed from service.

**NOTE:** Smoothness measurement is in accordance with ANSI B 46.1. One source of supply for a surface comparator, which is used to verify the rms value 1.60  $\mu\text{m}$ , is GAR Electroforming, Danbury, Connecticut.

**4.3.** Ram heads and mold bottoms shall be fabricated from steel with a minimum Rockwell hardness of C 48. The ram heads shall have a means for staying fixed to the ram and perpendicular to its axis. The platen side of each mold bottom shall be flat and parallel to its face. All ram and base plate faces (the sides presented to the specimen) shall be ground flat to meet smoothness requirement in **Section 4.2** of this test method and shall have a diameter of 149.50 to 149.75 mm.

**4.4.** Thermometers shall be armored, glass or dial-type thermometers with metal stems for determining temperature of aggregates, asphalt and asphalt mixtures between 122 to 450°F (50 to 260°C).

**4.5.** The balance shall conform to the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

**4.6.** An oven thermostatically controlled with a range from 122 to 450°F (50 to 260°C) with 5.4°F ( $\pm 3^\circ\text{C}$ ) tolerance, for heating aggregates, asphalt, asphalt mix and equipment as required. The oven shall be capable of maintaining the temperature required for short-term aging.

**4.7.** Miscellaneous equipment, flat bottom metal pans for heating aggregates; scoop for batching aggregates; containers; gill-type tins; beakers; containers for heating asphalt; large mixing spoon or small trowel; large spatula; welders gloves for handling hot equipment; paper disks; mechanical mixer (optional); and lubricating materials recommended by compactor manufacturer.

## **5. STANDARDIZATION**

**5.1.** Items requiring periodic verification of calibration include the ram pressure, the angle of gyration, the gyration frequency, the LVDT (or other means used to continuously record the specimen height) and oven temperature. Verification of the mold and platen dimensions and the inside finish of the mold are also required. When the computer and software options are used, periodically verify the data processing system output using a procedure design for such purposes. Verification of calibration, system standardization and quality checks may be performed by the manufacturer, other agencies providing such services or in-house personnel.

## 6. PREPARATION OF APPARATUS

6.1. Immediately prior to the time when the paving mix is ready for the placement in the mold, turn on the main power for the compactor for the manufacturer's required warm-up period.

6.2. Verify machine settings are correct for angle, pressure and number of gyrations.

**NOTE:** The required number of gyrations is shown in **Table 1**.

### 6.3. Pine AFGC125X gyratory compactor (Big Pine)

6.3.1. Lubricate with an oily rag any bearing surfaces except for the upper roller bearing ring which should be lubricated with an oil can, filled with motor oil. **Do not use graphite on bearings.**

6.3.2. Lightly lubricate the surface of the rotating base along with the surface of the four rollers.

6.4 When monitoring specimen height, the following additional item of preparation is required. Immediately prior to the time when paving mix is ready for placement in the mold, turn on the device for measuring and recording the height of the specimen and verify that the readout is in the proper units, mm, and that the recording device is ready. If used, prepare the computer to record the height data and enter the header information for the specimen.

## 7. MIXING AND COMPACTION PROCEDURE

*Refer to the attached Addendum if using hydrated lime as an anti stripping agent.*

7.1. Preparation of Reclaimed Material (if used): Place the reclaimed material in a 125 to 175°F (50 to 80°C) draft oven for 1 1/2 to 2 hours, to soften. Transfer the materials to the mixing bowl and mix for two minutes in order to breakdown the reclaimed material to the recommended sizes. (Mixer will mix approximately 3,500 g.) Other methods of breakdown are acceptable provided they do not fracture aggregates or lose an excessive amount of material in the process. Separate the reclaimed material into desired fractions by screening, when cool enough to screen. The following size fractions are recommended:

3/4 to 1/2 in (19.0 to 12.5 mm)	No.4 to No.8 (4.75 to 2.36 mm)
1/2 to 3/8 in (12.5 to 9.5 mm)	Passing No.8 (Passing 2.36 mm)
3/8 in to No.4 (9.5 to 4.75 mm)	

7.1.1. Weigh the appropriate aggregate and reclaimed material, if applicable, fractions into a separate pan and combine to the desired batch weight. The batch weight will vary based on the ultimate disposition of the test specimens. If a target air void level is desired, as would be the case for Superpave abbreviated mix analysis and/or full mix analysis performance specimens, batch weights will be adjusted to create a given density in a known volume. When specimens are to be used for determination of volumetric properties, the batch weights will be adjusted to result in a compacted specimen having dimensions of either 150 mm in diameter and  $115 \pm 5$  mm in height or 100 mm in diameter and  $63.5 \pm 2$  mm in height at the maximum number of gyrations.

**NOTE:** It may be necessary to produce a trial specimen to achieve this height requirement. Generally, 4500 g of aggregate for 150 mm plugs and 1200 g of aggregate for 100 mm plugs are required to achieve this height for aggregates with combined bulk specific of 2.55.

**7.2.** Place the aggregate, reclaimed material, if applicable, and the asphalt binder container in the oven and heat to the required mixing temperature.

**7.2.1.** The mixing temperature range is defined as the range of temperature where the unaged asphalt binder has a kinematic viscosity of  $170 \pm 20 \text{ mm}^2/\text{s}$  (approximately  $0.17 \pm 0.02 \text{ Pa}\cdot\text{s}$  for an asphalt binder density of  $1.00 \text{ g/cm}^3$ ) measured in accordance with **ASTM D 4402**.

**NOTE:** Modified asphalts may not adhere to the equi-viscosity requirements noted and the manufacturer's recommendations should be used to determine mixing and compaction temperature.

**NOTE:** The SI unit of kinematic viscosity is  $\text{m}^2/\text{s}$ ; for practical use, the submultiple  $\text{mm}^2$  is recommended. The more familiar centistokes, a cgs, unit of kinematic viscosity, is a ratio of asphalt binder viscosity to density. For an asphalt binder with equal density to  $1.000 \text{ g/cm}^3$ , a kinematic viscosity of  $170 \text{ mm}^2/\text{s}$  is equivalent to a viscosity of  $0.17 \text{ Pa}\cdot\text{s}$  measured in accordance with **ASTM D 4402**.

**7.3.** Charge the mixing bowl with the heated aggregate in one pan and reclaimed material, if required and dry mix thoroughly. Form a crater in the dry blended aggregate and weigh the required amount of asphalt binder into the mix. Immediately initiate mixing.

**7.4.** Mix the aggregate and asphalt binder as quickly and thoroughly as possible to yield a paving mix having a uniform distribution of asphalt binder. As an option, mechanical mixing may be used.

**7.5.** After completing the mixture preparation, place the loose mix in a shallow, flat pan and short-term age as it follows:

**7.5.1.** Place the mixture on a baking pan and spread it to an even thickness. Place the mixture and pan in the aging oven set at compaction temperature for  $2 \text{ hours} \pm 5 \text{ minutes}$ .

**7.5.1.1.** The compaction temperature range is defined as the range of temperature where the unaged asphalt binder as a kinematic viscosity of  $280 \pm 30 \text{ mm}^2/\text{s}$  (approximately  $0.28 \pm 0.03 \text{ Pa}\cdot\text{s}$ ) measured in accordance with **ASTM D 4402**.

**NOTE:** Modified asphalts may not adhere to the equi-viscosity requirements noted and the manufacturer's recommendations should be used to determine mixing and compaction temperatures.

**7.5.2.** Stir mixture every  $60 \pm 5 \text{ minutes}$  to maintain uniform aging.

**7.5.3.** After  $2 \text{ hours} \pm 5 \text{ minutes}$ , remove the mixture from the forced draft oven. The aged mixture is now ready for further conditioning or testing as required.

**7.6.** Place the compaction mold and base plate in an oven permitting the pieces to reach the established compaction temperature prior to the estimated beginning of the compaction process.

**7.7.** If loose HMA plant mix is used, the mixture shall be brought to the compaction temperature range by careful uniform heating in an oven immediately prior to molding.

**7.8.** When compaction temperature is achieved, remove the heated mold and base plate from the oven and place a paper disk on the bottom of the mold.

**7.9.** Thoroughly mix the material and place the mixture quickly into the mold in one lift and verify the temperature of the material. The temperature of the material is to be at the midpoint of the established

compaction temperature  $\pm 3^{\circ}\text{F}$  ( $\pm 1.5^{\circ}\text{C}$ ) for the specified PG asphalt. Care should be taken to avoid segregation in the mold. After all the mix is in the mold, temperature verified, then level the mix and place another paper disk on top of the leveled material and add the top plate.

**7.10.** Load the specimen mold with the paving mix into the compactor and center the mold under the loading ram.

**7.11.** Lower the ram until the pressure on the specimen reaches  $600 \pm 18$  kPa.

**7.12.** Apply a  $1.16 \pm 0.02$  degrees internal angle to the mold assembly and begin the gyratory compaction.

**7.13.** Allow the compaction to proceed until the desired number of gyrations is reached and the gyratory mechanism shuts off.

**7.14.** Remove the angle from the mold assembly, raise the loading ram, remove the mold from the compactor and extrude the specimen from the mold.

**NOTE:** Specimen can be extruded from the mold immediately for most HMA paving mixes. For lean, rich or tender mixtures, a cooling period of 5 to 10 minutes in front of a fan may be necessary before extruding the specimen.

**7.15.** Remove the paper disks from the top and bottom of the specimens. Before reusing the mold, place it in an oven until the mold reaches compaction temperature. The use of multiple molds will speed up the compaction process.

**NOTE:** The extruded specimen may not be a right angle cylinder. Specimen ends may need to be sawed to conform to the requirements of specific performance tests.

## **8. DENSITY PROCEDURE**

**8.1.** When the specimen height is to be monitored, the following steps are required in addition to those specified **Section 7** of this test method.

**8.1.1.** Determine the maximum specific gravity ( $G_{mm}$ ) of the loose mix in accordance with **KT-39** using a companion sample. The companion sample shall be aged to the same extent as the compaction sample.

**8.1.2.** Record the specimen height to the nearest 0.1 mm after each revolution.

**8.1.3.** Record the mass of the extruded specimen to the nearest gram and determine the bulk specific gravity ( $G_{mb}$ ) of the extruded specimen in accordance with **KT-15, Procedure III** of this manual.

## **9. DENSITY CALCULATIONS**

**9.1.** Calculate the uncorrected relative density ( $C_{ux}$ ) at any point in the compaction process using the following equation:

$$C_{ux} = \frac{100 (W_m)}{V_{mx} G_{mm} G_w}$$

Where:  $C_{ux}$  = Uncorrected relative density at any point during compaction expressed as a percent of the theoretical maximum specific gravity

$W_m$  = The mass of the specimen in grams

$G_{mm}$  = Theoretical maximum specific gravity of the mix

$G_w$  = The unit of water, 1 g/cm<sup>3</sup>

$X$  = The number of gyrations

$V_{mx}$  = The volume of the specimen, in cm<sup>3</sup>, at any point based on the diameter ( $d$ ) and height ( $h_x$ ) of the specimen at the point (use mm for height and diameter measurements).

It can be expressed as:

$$V_{mx} = \frac{\pi d^2 h_2}{4(1000)}$$

**NOTE:** This formula gives volume in cm<sup>3</sup> to allow direct comparison with specific gravity.

**9.2.** At the completion of the bulk specific gravity test, determine the percent compaction ( $C_x$ ) at any point in the compaction process as follows:

$$C_x = \frac{100 (G_{mb} h_m)}{G_{mm} h_x}$$

Where:  $C_{ux}$  = Corrected relative density expressed as a percentage of the maximum theoretical specific gravity

$G_{mb}$  = Bulk specific gravity of the extruded specimen.

$h_m$  = Height in mm of the extruded specimen

$h_x$  = Height in mm of the specimen after “x” gyrations

## 10. REPORT

**10.1.** Project number.

**10.2.** Date of test.

**10.3.** Start time of test.

**10.4.** Specimen identification.

**10.5.** Percent binder in specimen, nearest 0.1%.

**10.6.** Average diameter of the mold used in ( $d$ ), nearest 0.01 mm.

**10.7.** Mass of the specimen ( $W_m$ ), nearest g.

**10.8.** Theoretical maximum specific gravity ( $G_{mm}$ ) of the specimen by **KT-39**, nearest 0.001.

**10.9.** Bulk specific gravity ( $G_{mb}$ ) of the specimen by **KT-15 Procedure III** of this manual, nearest 0.001.

**10.10.** Height of the specimen after each gyration ( $h_2$ ), nearest 0.1 mm.

**10.11.** Relative density ( $C_x$ ) expressed as a percent of the theoretical maximum specific gravity, nearest 0.1 %.

### ADDENDUM TO KT-58 FOR INCLUDING LIME AS AN ANTISTRIPPING AGENT

The following information provides **KT-58** with steps to incorporate hydrated lime as an antistripping agent.

Delete **sections 7.1 and 7.2** of this test method and replace with the following:

**7.1.** Weigh the appropriate aggregate fractions into a separate pan and combine to the desired batch weight. The batch weight will vary based on the ultimate disposition of the test specimens. Include the hydrated lime weight required to meet the specified percent of lime for the project as part of the total batch weight. The total aggregate weight should include lime, virgin aggregate, and reclaimed material (if applicable). If a target air void level is desired as would be the case for Superpave abbreviated mix analysis and /or full mix analysis performance specimens, batch weights will be adjusted to create a given density in a known volume. If specimens are to be used for determination of volumetric properties, the batch weights will be adjusted to result in a compacted specimen having dimensions of 150 mm in diameter and  $115 \pm 5$  mm in height at the maximum number of gyrations.

**NOTE:** It may be necessary to produce a trial specimen to achieve this height requirement. Generally, 4500 g of aggregate for 150 mm plugs and 1200 g of aggregate for 100 mm plugs are required to achieve this height for aggregates with combined bulk specific gravities of 2.55.

**7.1.1.** Determine the SSD condition (**KT-06**) for the combined aggregate gradation. Add 3% of moisture to the percent moisture required to reach the SSD condition of the combined aggregate.

**7.1.2.** Place the combined virgin aggregate and hydrated lime in a mixing bowl. Carefully mix until the hydrated lime is combined with the aggregate. Add the appropriate water content, as determined in **Section 7.1.1** of the addendum to this test method and thoroughly mix.

**7.1.3.** Oven dry the aggregate mix at  $230 \pm 9^\circ\text{F}$  ( $110 \pm 5^\circ\text{C}$ ) to a constant mass.

**7.2.** Combine the virgin aggregate material with the reclaimed material, if applicable, and thoroughly mix. Place the aggregate and the asphalt binder container in the oven and heat to the required mixing temperature.

5.9.59 FLAT AND ELONGATED PARTICLES IN COARSE MATERIAL TEST  
(Kansas Test Method KT-59)

## 1. SCOPE

This test method covers the determination of the percentage of flat and elongated particles in coarse aggregates. **KT-59** reflects testing procedures found in **ASTM D4791**.

## 2. REFERENCED DOCUMENTS

2.1. Part V, 5.9; Sampling and Test Methods Foreword

2.2 KT-01; Sampling and Splitting of Aggregates

2.3. KT-02; Sieve Analysis of Aggregates

2.4. ASTM E11; Woven Wire Test Sieve Cloth and Test Sieves

2.5. ASTM D4791; Standard Test Method for Flat Particles, Elongated Particles, or Flat and Elongated Particles in Coarse Aggregate

## 3. DEFINITIONS

3.1. Flat and elongated particles of aggregate-those particles of aggregate having a ratio of length to thickness greater than a specified value.

3.2. A flat and elongated particle exists when the particle's small ratio (the 1 in 5:1) slides the full length through the opening established by the large ratio number (the 5 in 5:1). **EXAMPLE:** Checking flat and elongated particles requires comparing the length vs. thickness. After setting the large ratio to the maximum length of the particle, attempt to slide the flattest portion of the particle horizontally through the opening of the small ratio. If the particle passes clear through the opening, then the particle is flat and elongated.

## 4. SIGNIFICANCE AND USE

4.1. Flat and elongated particles of aggregates, for some construction uses, may interfere with consolidation and result in harsh, difficult to place materials.

4.2. This test method provides a means for checking compliance with specifications that limit such particles, or to determine the relative shape characteristics of coarse aggregates.

## 5. APPARATUS

5.1. Use apparatus suitable for testing aggregate particles for compliance with the definition in **Section 3.1** of this test method, at the dimensional ratios desired.

5.1.1. The proportional caliper device illustrated in **Figure 1** is an example of all apparatus suitable for this test method. It consists of a base plate with two fixed posts and a swinging arm mounted between them so that the openings between the arms and the posts maintain a constant ratio.

The caliper and pins are to be perpendicular to the base plate and raise at least 2 in (50 mm) in height. Design the caliper to touch the length of the fixed pins simultaneously. Provide a 5:1 ratio between the two fixed pins (or as required by contract documents). Design the center pin so the caliper can be easily locked into position. Make the base plate, caliper and pins of rigid and durable materials.

**Figure 1 Proportional Caliper**

Illustrates a device on which the ratio 5:1 is set.

**5.1.2.** Balance to meet the requirements of **Part V, 5.9; Sampling and Test Methods Foreword**, for the class of general purpose balance required for the principal sample mass of the sample being tested.

**5.1.3.** Drying oven capable of maintaining a uniform temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**5.1.4.** Sieves meeting **ASTM E11**.

## 6. SAMPLING

**6.1.** Sample the combined aggregate in accordance with **KT-01, Section 3**. Normally the sample is taken from the combined aggregate stream. The procedure may also be used to test individual coarse aggregate stockpiles to determine suitability for use. Obtain a large enough sample to yield the required plus 4 material listed in **Section 6.2 Table 1**.

**6.1.1.** Sieve the material over the No. 4 (4.75 mm) screen. Discard all material passing the No. 4 (4.75 mm) screen.

**6.1.2.** Oven dry the sample to constant mass at a temperature of  $230 \pm 9^{\circ}\text{F}$  ( $110 \pm 5^{\circ}\text{C}$ ).

**6.2.** Thoroughly mix the test sample and reduce it to an amount suitable for testing using the mass desired when dry as an end result of the reduction. Reduction to an exact predetermined mass is not permitted. Determine the original dry mass of the sample. The mass of the plus No. 4 material shall conform to the following:

**Table 1**

Nominal Maximum Aggregate Size, in. (mm)	Min. Dry Mass of +4 Sample, lb (kg)
1 1/2 in (37.5 mm)	33 lb (15 kg)
1 in (25.0 mm)	22 lb (10 kg)
3/4 in (19.0 mm)	11 lb (5 kg)
1/2 in (12.5 mm)	4 lb (2 kg)
3/8 in (9.5 mm)	2 lb (1 kg)
No. 4 (4.75 mm)	1 lb (0.5 kg)

**NOTE:** Nominal maximum aggregate size is one size larger than the first sieve to retain more than 10%.

## 7. PROCEDURE

**7.1.** Sieve the sample of coarse aggregate to be tested in accordance with **KT-02, Section 6**. Separately retain and determine the mass of each sieve size fraction. Reduce each size fraction larger than the No. 4 (4.75 mm) sieve present in the amount of 10% or more of the original sample in accordance with **KT-01, Section 4** until approximately 100 particles are obtained. Determine the mass of each reduced size fraction.

**7.2.** Using a proportional caliper device, set at a 5:1 ratio (or as required by the contract documents). Test each of the particles in each size fraction for flat and elongated.

**7.2.1.** Set the larger opening equal to the particle length. The particle is flat and elongated if the flattest portion of the particle can be placed through the smaller opening. Determine the proportion of the sample in each group by mass.

## 8. CALCULATIONS

**8.1.** Calculate the percent of flat and elongate particles to the nearest 1% for each sieve size greater than No. 4 (4.75 mm).

**8.2.** When a weighted average for a sample is required, assume that the sieve sizes not tested (those representing less than 10% of the sample) have the same percentage of flat and elongated particles as the next smaller or the next larger size, or use the average for the next smaller and larger sizes, if both are present.

**8.3.** Calculate the flat and elongated on each sieve:

$$\% \text{ F\&E} \quad D = \frac{C(100)}{B}$$

Where: C= mass of flat and elongated particles  
B= mass of 100± particles tested  
D= % F&E

Calculate the % weighted of F&E on each sieve:

$$E = \frac{(A)(D)}{100}$$

Where: A = % of original sample retained on sieve  
D = % F&E  
E = weighted % Calculate to the % total weighted F&E for a given sample:

Sieve	Individual Sieve Mass (grams)	% Sieve Size Fraction = A	*Mass of Reduced "100 Piece Pile" (grams) = B	Failed Aggregate		
				Failed Mass Fraction (grams) = C	% Failed = D	Weighted % = E
1 1/2"	--	--	--	--	--	--
1"	--	--	--	--	--	--
3/4"	--	--	--	--	--	--
1/2"	1200	60	150	27	18	11
3/8"	740	37	75	8	11	4
#4	60	3	--	--	11	0
Original Dry Mass of #4	2000			Total % Failed F & E = F		15

Total % Failed F&E (F) = sum of all individual weighted percent F&E

\*individual mass quantities are after reduction to approximately 100 pieces (**Section 7.2**, of this test method)

**NOTE #1:** If percent retained on sieve is less than 10% do not test for flat and elongated.

**NOTE #2:** If percent retained on sieve is less than 10% use %F&E from adjacent sieve or average of next larger and next smaller sieve.

## 9. REPORT

**9.1.** Include the following information in the report:

**9.1.2.** Grading of the aggregate sample, showing percentage retained on each sieve.

**9.1.3.** Percentages, calculated by mass for flat and elongated particles, for each sieve size tested, and the combined aggregate percent for flat and elongated particles.

**9.1.4.** When required, weighted average percentages based on the actual or assumed proportions of the various sieve sizes tested. Report the grading used for the weighted average if different from that in **Section 9.1.2** of this test method.

**9.1.5.** Record the flat and elongated particles to the nearest 1%. Report the flat and elongated particles to the nearest 1%.

## **10. PRECISION AND BIAS**

**10.1. Precision-**The precision of this test method is found in **ASTM D4791**.

**10.2. Bias-**Since there is no accepted reference material suitable for determining the bias for this test method no statement on bias is being made.

## INCLUDED IN THIS VOLUME

1. **SPECIAL PROVISION 15-06007-R03** – *Hot Mix Asphalt (HMA) Construction (Quality Control/Quality Assurance (QC/QA)) of the 2015 Kansas Department of Transportation Standard Specifications for State Road and Bridge Construction*
2. **SAMPLING and TESTING FREQUENCY CHART (BTH, 2021)** – Lists "Record to Accuracy" for HMA Material Tests (Part V, Appendix B, pages 1-14)

### **Note:**

2015 KDOT Standard Specifications for State Road and Bridge

Construction Located on the KDOT Web Site; link below:

**602.2 CONTRACTOR QUALITY CONTROL REQUIREMENTS**

**a. General.** Provide qualified personnel and sufficient equipment complying with the requirements listed in Part V to conduct quality control testing that complies with Appendix B, Sampling and Testing Frequency Chart for Asphalt Construction Items for Quality Control/Quality Assurance Projects.

Allow the Engineer access to the Contractor's laboratory to observe testing procedures, calculations, test documentation and plotting of test results.

Calibrate and correlate the testing equipment with prescribed procedures, and conduct tests in compliance with specified testing procedures as listed in Part V.

Maintain a Quality Manual in the field laboratory showing the calibrations performed on all test equipment and when the next calibration is due for that equipment. As a minimum, follow the calibration/verification interval established in Table 2: HMA Materials Test Equipment in Section 5.2.7.1-HMA: Contractor's Quality Control Plan, Part V. See also, Section 5.2.7.3-Example of a Laboratory Quality Manual for HMA, Part V.

Store and retain the most recent 2 lots per mix designation of quality control samples for KDOT. KDOT will retain the most recent 2 lots per mix designation gyratory compacted air voids (Va) verification samples and the remaining material not previously used for testing (back half of sample). Do not retain more than the previous 3 lots per mix designation of quality control or verification samples. When the hot mix plant shuts down for the winter, discard the samples after 7 days.

**b. Quality Control Plan (QCP).** At the pre-construction conference, submit to the Engineer for approval, a QCP as outlined in Section 5.2.7-Contractor's Quality Control Plan, Part V. Follow 5.2.7.1-HMA: Contractor's Quality Control Plan in Part V as a general guideline. The Contractor's laboratory and equipment will be inspected and approved as outlined in Section 5.2.7-Contractor's Quality Control Plan, Part V.

Include a listing of the names and phone numbers of individuals and alternates responsible for quality control administration and inspection. On the Contractor's organizational chart, show the specified lines of authority relating both to mix design and quality control operations during production. Post the organizational chart in the Contractor's test facility.

Provide a quality control organization or private testing firm having personnel certified according to the Policy and Procedures Manual for The Certified Inspection and Testing (CIT) Training Program. The testing for this type of construction will require personnel certified in Aggregate Field Tester (AGF), Aggregate Lab Technician (AGL), Superpave Field (SF), Profilograph (PO) and Nuclear Moisture Density Gauge Tester (NUC) classifications. Provide a minimum of 1 employee on the project certified in the QC/QA Asphalt Specs (QCA) classification.

Only persons certified in the appropriate classifications covering the specific tests required shall perform such testing. At the beginning of the project, provide the Engineer with the list of certified technicians and alternates, phone numbers and tests/inspection they will be performing. Include certification expiration dates for all certified technicians. As personnel changes and certifications may expire, continue to provide the Engineer with an accurate list.

Provide an organizational chart showing the specified lines of authority relating to both mix design and quality control operations during production. Identify the company official acting as liaison with KDOT, and the Certified Technician who will direct inspection and testing. Post the chart in the test facility.

**c. Required Duties of Certified Inspectors.** Be available on the project site whenever HMA is being produced and being placed on the project site. Perform and utilize quality control tests and other quality control practices to assure that delivered materials and proportioning meet the requirements of the mix designs.

Periodically inspect all equipment utilized in transporting, proportioning, mixing, placing and compacting to assure it is operating properly and that placement and compaction comply with the contract requirements.

**d. Contractor's Testing Facilities.** Describe the testing facility and its accreditation in the QCP.

Locate the testing facility either at the plant site or at the project. Obtain approval of the testing facilities and location from the DME before the commencement of mixture production.

Provide suitable space for the required testing equipment. Also, equip the testing facility with these items for the exclusive use of the testing facility's quality control personnel and the Engineer:

A telephone with a private line for the exclusive use of the testing facility's quality control personnel; and

A copying machine for use by the Contractor's personnel and the Engineer.

Broadband internet connection (for 1 computer). If the Engineer determines that broadband internet service is not available, provide a fax machine, at no additional cost.

An air conditioner capable of maintaining a temperature below 77°F in the main part of the Field Office and Laboratory.

Locate the KDOT field laboratory near the Contractor's testing facility and have it fully functional 2 working days before placement of the pre-production mix.

**e. Documentation.** Include in the QCP procedures, charts and forms to be used to provide the required documentation.

Record all original documentation in a bound field book or other KDOT approved bound record and turn over to KDOT at the end of the project.

At all times, have complete records of all inspections and tests available on site for the Engineer. All records documenting the Contractor's quality control inspections and tests become the property of KDOT upon completion of the work.

Indicate the nature and number of observations made, the number and type of deficiencies found, the quantities approved and rejected, and the corrective action taken in the records. Examples of quality control forms and charts are available in Part V, or Contractors may design their own. Documentation procedures are subject to approval by the Engineer before the start of the work and to compliance checks during the progress of the work.

Maintain control charts on an ongoing basis.

Provide the following test data to the KDOT Project Representative:

- Copies of all test results and control charts on a weekly basis, representing the prior week's production;
- Copies of the quality control summary sheet when available and not later than the next working day of obtaining the sample. Include, as a minimum, mix gradation, binder content, theoretical maximum

- specific gravity ( $G_{mm}$ ), air voids ( $V_a$ ) at  $N_{des}$ , percent  $G_{mm}$  at  $N_{ini}$  and  $N_{max}$ , voids in mineral aggregate (VMA), voids filled with asphalt (VFA) and dust to effective binder content (D/B) ratio;
- Copies of all failing test results when available (based on a moving average of 4 tests, when appropriate). Include all applicable sieves, VMA, VFA, density at  $N_{ini}$  and  $N_{max}$ , and D/B ratio; and
- Copies of KT-56 test results when available and not later than five working days of obtaining the sample.

**f. Testing Requirements.** In the QCP, identify test methods, procedures and equipment proposed for use. Use standard KDOT test methods and properly calibrated measuring and testing equipment as outlined in Part V. Detail any alternative sampling method, procedure or inspection equipment proposed to be used. Such alternatives are subject to review and approval by the DME.

Take all samples for tests and perform in-place tests at random locations, selected according to the Contractor's QCP and at the rates specified in the Sampling and Testing Frequency Chart for Hot Mix Asphalt for Quality Control/Quality Assurance Projects in Appendix B, Part V.

**g. Pre-Production Testing Requirements.**

(1) The Engineer will observe the Contractor obtaining and splitting the pre-production test section sample into 3 representative portions. Each sample set shall consist of enough material for 2 gyratory specimens, theoretical  $G_{mm}$  and ignition burnoff.

(2) Mold 2 gyratory specimens from the 1<sup>st</sup> sample set immediately, while still hot. Additional heating may be required to raise the temperature of the sample to compaction temperature. Determine  $G_{mm}$ , perform ignition burnoff and complete calculations.

(3) Provide the KDOT Field Representative with the 2<sup>nd</sup> sample set. The KDOT Field Representative will mold 2 gyratory specimens, determine  $G_{mm}$ , perform ignition burnoff and complete calculations.

(4) Retain or provide the 3<sup>rd</sup> sample set to the KDOT District Materials Representative.

(5) The results of the testing will be compared. If Contractor and KDOT field laboratory test results do not compare favorably, the District Materials Laboratory will test their  $\frac{1}{3}$  of the sample. This sample will be transported to the District Materials Laboratory, after it has cooled to ambient air temperature. KDOT personnel will reheat the sample to compaction temperature, mold 2 gyratory specimens, determine  $G_{mm}$ , perform ignition burnoff and complete calculations. If the 3<sup>rd</sup> sample set is collected, transported while hot to the District Materials Laboratory and compacted in less than 2 hours, then, at the DME's discretion, the requirement to cool the sample may be waived.

If results are not acceptable to either party, repeat the above steps in **subsections 602.2g.(1) through (5)** for the Contractor's Field Laboratory, KDOT's Field Laboratory, and District Materials Laboratory until the issues may be resolved satisfactorily by all parties.

**h. Lot 1 Testing Requirements.**

(1) Sequence of Sampling. KDOT field personnel will determine the random truckload for the Contractor for sublots A, B, C and D, and the KDOT verification test.

The verification sample will be sampled and tested by KDOT field personnel. The verification sample shall be randomly taken within the lot and shall not be the same truckload as selected for the Contractor's subplot A, B, C or D.

KDOT field personnel will:

- provide the random spots to sample from behind the paving operations before compaction (KT-25);
- not supply the Contractor the identity of the truckload to be sampled ahead of time;
- notify the Contractor's laboratory of which truck to sample after the aggregate has left the cold feeds, and before the truck is finished loading; and
- determine whether the split sample will be taken from subplot A or B and notify the Contractor.

(2) Split Samples. The Contractor shall:

- obtain a sample large enough to split 3 ways for testing;
- retain and test  $\frac{1}{3}$  of the sample;
- supply  $\frac{1}{3}$  of the sample to the KDOT field laboratory for testing; and
- supply  $\frac{1}{3}$  of the sample to the KDOT District Materials Laboratory for testing.

(3) Results. At a minimum, compare  $G_{mm}$  and  $V_a$  results. The acceptable differences are 0.019 and 0.5%, respectively. If the results exceed these differences, take an additional split sample in Lot 1 from subplot C or D, as time permits.

If test results do not compare favorably, KDOT and the Contractor will investigate the differences in test results together and take appropriate action. The Contractor's test results will be used for quality control. KDOT Field Laboratory test results and District Materials Laboratory test results will be reported as "information only" samples.

**i. Testing Requirements for Lots 2 and Greater.**

(1) Take all samples for tests at random locations as designated in the approved QCP at the rates specified in Appendix B, Part V.

Provide the Engineer with the random locations before going to the roadway to determine density or sample the HMA. The Engineer reserves the right to generate the random locations. If the Engineer generates the random locations, the Contractor will be notified before going to the roadway to sample the HMA or determine density.

(2) Conduct the tests for mixture properties, aggregate gradation and binder content on representative portions of the HMA, quartered from the larger sample of HMA. Take a random sample weighing a minimum of 55 pounds from behind the paver and transport it to the test facility, using a method to retain heat to facilitate sample quartering procedures.

(3) Record and document all test results and calculations on data sheets provided by KDOT. Record specific test results on a daily summary sheet provided by KDOT to facilitate the computation of moving test averages. Base moving averages on 4 consecutive test results. Calculations are to be based on the precision displayed on the data sheets. Use "precision displayed" when calculating within Excel. Appendix B, Part V shows the accuracy to "record to" for the tests listed. Include a description of quality control actions taken (adjustment of cold feed percentages, changes in Job Mix Formulas (JMF), etc.) in the Daily Quality Control Summary Sheet. In addition, post and keep current quality control charts, showing both individual test results and moving average values. As a minimum, plot the single test values and the 4 test moving average values, as applicable, on KDOT approved control charts for the mix characteristics shown in **TABLE 602-12**.

(4) If the Contractor and Engineer agree, the procedures shown for sampling, testing and evaluation of Lot 1 in **subsection 602.2h**, may be used for any other Lot produced on the project.

**j. Corrective Action.** In the QCP, identify procedures for notifying the Engineer when corrective measures must be implemented, and for halting production.

**k. Non-Conforming Materials.** In the QCP, specifically address how non-conforming materials will be controlled and identified. Establish and maintain an effective and positive system for controlling non-complying material, including procedures for its identification, isolation and disposition. Reclaim or rework non-complying materials according to procedures acceptable to the Engineer. This could include removal and replacement of in-place pavement.

Positively identify all non-conforming materials and products to prevent use, shipment and intermingling with complying materials and products. Provide holding areas, mutually agreeable to the Engineer and Contractor.

### **602.3 MATERIALS**

**a. Asphalt Binder.** Provide Asphalt Binder that complies with **DIVISION 1200**. Post a legible copy of the latest bill of lading for the Asphalt Binder on or near the gyratory compactor. Use the mixing and compaction temperatures shown on the bill of lading; however, the maximum mixing or compaction temperature is 340°F, unless otherwise approved by the Field Materials Engineer. Notify the Engineer if the mixing or compaction temperature changes.

Exception: The mixing temperature may be increased no more than 10°F above the maximum mixing temperature shown on the bill of lading provided all the following are met:

- The air temperature is below 70°F.
- The plant has not produced mix earlier in the day.
- Do not exceed a mix temperature of 350°F.
- No truck has returned for its second load of the day.

Once a previously loaded truck returns for its next load, reduce the temperature to not higher than the maximum mix temperature shown on the bill of lading, not to exceed 340°F.

**b. Reclaimed Asphalt Pavement (RAP) and Recycled Asphalt Shingles (RAS).** Provide RAP and RAS that comply with **SECTION 1103**.

**c. Aggregates.** Provide aggregates that comply with **SECTION 1103**.

**d. Combined Aggregates.** Provide combined aggregates for the mixes required in the Contract Documents as shown in **TABLE 602-1**.

Mixes may use any combination of aggregate and mineral filler supplements complying with the applicable requirements in **TABLES 1103-1** and **1103-2**.

Provide materials with less than 0.5% moisture in the final mixture.

The maximum quantity of crushed steel slag used in the mix is 50% of the total aggregate weight.

For all mixes used on the traveled way, the maximum quantity of natural sand is 35%.

Natural sand shall be called SSG-1, SSG-2, etc. in the mix design.

Additional requirements for SM-9.5T and SR-9.5T:

- Traveled way mixes shall include a minimum of 40% primary aggregate based on total aggregate weight;
- A minimum of 50% of the plus No. 4 mesh sieve material in the mixture shall be from the primary aggregate;
- A minimum of 45% of the plus No. 8 mesh sieve material in the mixture shall be from the primary aggregate; and
- Primary aggregates are designated as CS-1 (excluding limestone), CS-2 (excluding limestone), CG, CH-1 and CSSL as described in **subsection 1103.2a.(1)**. Primary aggregate requirements do not apply to the mixture used on the shoulder.

**e. Contractor Trial Mix Design.** A minimum of 10 working days before the start of HMA production, submit in writing to the DME for review and approval, a proposed JMF for each combination of aggregates. For each JMF submitted, include test data to demonstrate that mixtures complying with each proposed JMF shall have properties specified in **TABLE 602-1** for the designated mix type at the Recommended Percent Asphalt ( $P_{br}$ ). Submit the proposed JMF on forms provided by KDOT. Submit the worksheets used in the design process to include at a minimum the mix properties listed in **TABLE 602-2**. Contact the DME to determine if additional information should be submitted. Provide sufficient material as identified in **TABLE 602-3**. Contact the DME to determine if additional material is needed for additional design checks such as the modified Lottman test (KT-56).

When more than 25% of the mix is comprised of siliceous virgin aggregates and/or RAP, add anti-strip to the mix. The minimum amount of anti-strip required in the mix is 0.01% for every percent of natural sand and RAP in the mix. Thus, if 25% natural sand and 10% RAP is in a mix, then 0.35% anti-strip by weight of virgin asphalt binder is required in the mix.

If during production, the Tensile Strength Ratio (TSR) values (both KDOT and Contractor) exceed 85%, then the Contractor and the DME, working together, may decide on a lower amount of anti-strip.

Submit for the Engineer's review and approval, the test data listed in **TABLE 602-4** for each blend and the proposed JMF. In addition, for mixes containing RAP or RAS, submit for the Engineer's review and approval, the test data listed in **TABLE 602-5** for each blend and the proposed JMF. Submit a mix design for each blend and the proposed JMF as outlined in **TABLE 602-6**.

For each aggregate used in the mix design, determine the specific gravity using KT-06. This may be accomplished while the project is being constructed or anytime during the 12 months preceding the start of construction on a project. If construction has not yet begun, notify the DME 5 working days prior to obtaining the material for the specific gravity test so that companion samples may be obtained at the same time. If construction has already begun on the project, then determine the specific gravity values of the individual aggregates before 10,000 tons of HMA is produced. Provide the test results to the DME within 14 days of sampling the material. If the producer of the aggregate has been required to submit material to KDOT for a new Official Quality test, since the time the Contractor ran the specific gravity tests, then perform KT-06 on the aggregate currently produced. Do not use the specific gravity values obtained from these tests in the mix design calculations for current projects, unless mutually agreeable to both parties. Use the information, as soon as it becomes available, as part of the process to verify and update the "Monthly Hot Mix Aggregate Specific Gravity Values" posted on KDOT's Internet site.

TABLE 602-1: COMBINED AGGREGATE REQUIREMENTS

1. The requirements for Coarse Aggregate Angularity (CAA); Fine Aggregate Angularity (FAA); Sand Equivalent (SE); percent RAP; binder grade; Gyratory compaction revolutions  $N_{ini}$ ,  $N_{des}$ ,  $N_{max}$ ,  $N_{ini}$  level of compaction and VFA shall be as shown in the Contract Special Provisions for each mix designation.
2. The flat and elongated particles in the combined coarse aggregate shall not exceed 10% for the total sample.
3. The maximum percent moisture in the final mixture shall not exceed 0.5 for any mix designation.
4. The target air voids ( $V_a$ ) for any mix designation shall be 3.0% at  $N_{des}$  gyrations.
5. The minimum tensile strength ratio (%TSR) shall be 80% for any mix designation.
6. The level of compaction of the mix when compacted to  $N_{ini}$  gyrations shall be less than the percent of the  $G_{mm}$  shown in the Contract Special Provision, and when compacted to  $N_{max}$  gyrations shall be a maximum of 98.5% of the  $G_{mm}$ .
7. For mixes containing recycled asphalt shingles (RAS), increase the minimum VMA requirement in TABLE 602-1 by 0.1 percent for every 1 percent RAS (by weight of aggregate) in the JMF.

TABLE 602-2: MIX PROPERTIES			
Property	Abbreviation	Test Method	Additional Information
Air Voids	$V_a$	KT-15 & KT-58	Calculated from $G_{mm}$ and $G_{mb}$ . Run at the $P_{br}$ .
Recommended Percent Asphalt	$P_{br}$		Produce a mix with a $V_a$ of 2.5% to 3.5%.
Theoretical Maximum Specific Gravity	$G_{mm}$	KT-39	Rice Test.
Percent Tensile Strength Ratio	%TSR	KT-56	Run test at $P_{br}$ or at 0.3% to 0.5% less than $P_{br}$
Sand Equivalent	SE	KT-55	
Bulk Specific Gravity of HMA	$G_{mb}$	KT-15	Compacted Mix Property.
Percent $G_{mm}$ at $N_{ini}$ and $N_{des}$ and $N_{max}$	% $G_{mm}$ @ $N_{ini}$ % $G_{mm}$ @ $N_{des}$ % $G_{mm}$ @ $N_{max}$	KT-15	Use $G_{mm}$ value from KT-39. Calculated from Gyratory Compaction height data, $G_{mm}$ , and $G_{mb}$ .
Voids in Mineral Aggregate	VMA	KT-15 & KT-06	Calculated from $G_{mb}$ , $G_{sb}$ , $P_b$ .
Voids Filled with Asphalt	VFA		Calculated from VMA and $V_a$ @ $N_{des}$ .
Coarse Aggregate Angularity	CAA	KT-31	
Fine Aggregate Angularity	FAA	KT-50	

Formulas for calculations are in the Superpave Volumetric Mixture Design and Analysis Handbook.

TABLE 602-3: MATERIAL SUBMITTALS			
Submittal	Quantity	Description	Additional Information
Aggregate for KT-15	3 Samples	Sized for 6 inch Plugs	Comply with Job Mix Gradation.
Aggregate for KT-39	2 Samples	Sized for $G_{mm}$ Testing	Comply with Job Mix Gradation.
Binder for KT-15	As Needed	Sized for 3 Plugs at $P_{br}$	
Binder for KT-39	As Needed	Sized for 2 $G_{mm}$ Tests	
Each Aggregate for KT-06	As Needed	Specific Gravity Test	
Uncompacted HMA Sample	35 lbs	Cool sample to room temperature	If transported hot and compacted within 2 hours, then requirement to cool sample may be waived by the DME.
Gyratory Plugs at $N_{max}$	2 Plugs	Compacted at $P_{br}$	Compacted to $N_{max}$ .

TABLE 602-4: TEST DATA SUBMITTALS	
Submittal	Information
Asphalt Binder	Source, Grade, Specific Gravity, Mixing and Compaction Temperature from the Producer of the asphalt binder.
Each Aggregate	Source and Producer, including Legal Description.
Gradation of Each Aggregate	Percentage Retained to nearest 1% (except nearest 0.1% for No. 200 sieve) Derive RAP gradation after residual binder is removed. Derive RAS gradation after residual binder is removed or from the Shingle Aggregate Gradation table in SECTION 1103.
Material Proportioning	Proportion of each material is shown in percentage of aggregate.
Composite Gradation	Based on Gradation of Each Aggregate and Material Proportioning.
Composite Gradation Plot	Plotted on KDOT Form 712 (0.45 power graph paper).
Asphalt Binder Added	Percentage to nearest 0.01% based on total weight of the mixture.
Aggregate	Percentage of flat and elongated particles in the coarse aggregate, CAA and FAA.
%TSR	Percent Tensile Strength Ratio of the Mixture (Modified Lottman Test).
Sand Equivalent	SE for the combined virgin aggregates.

TABLE 602-5: RAP AND RAS TEST DATA SUBMITTALS	
Submittal	Information
RAP and RAS	Source and location where RAP will be obtained. Source and location where RAS will be obtained.
RAP Aggregate	Bulk Specific Gravity ( $G_{sb}$ ). Use the $G_{sb}$ provided on the Contract Special Provision. If no value is provided, the Effective Specific Gravity ( $G_{se}$ ) shall be calculated as shown in subsection 5.10.4, Part V and used as the $G_{sb}$ .
RAS Aggregate	Bulk Specific Gravity ( $G_{sb}$ ). The Effective Specific Gravity ( $G_{se}$ ) shall be calculated as shown in subsection 5.10.4, Part V and used as the $G_{sb}$ .
Asphalt Binder Content of RAP Asphalt Binder Content of RAS	Determined from ignition oven analysis using KT-57.
RAP $G_{mm}$ RAS $G_{mm}$	Determined by KT-39.
Asphalt Binder Specific Gravity	Specific Gravity of the asphalt binder in the RAP and RAS ( $G_b$ ) shall be set equal to 1.035.
Corrected Asphalt Binder Content of the total recycled mixture	Determined from ignition oven analysis using KT-57.

TABLE 602-6: MIX DESIGN TEST DATA SUBMITTALS	
Submittal	Information
Minimum of 2 Mix Designs	As a minimum, 1 mix design at the $P_{br}$ and 1 mix design at 0.3% to 0.5% below the $P_{br}$
$G_{mm}$	Determined at each binder content.
Individual and Bulk Specific Gravity Tests	Provide results for a minimum of 2 specimens at each binder content.
Percent Air Voids	Provide % $V_a$ in the mixture for each binder content when compacted to $N_{ini}$ , $N_{des}$ and $N_{max}$ gyratory revolutions along with copies of the Gyratory graphs.
Percent VMA	Provide %VMA at each binder content. (Note: The Contractor is cautioned that plant produced material generally yields a mixture with less VMA than predicted by the design. In such case, the design VMA should be increased above the specified minimum accordingly.)
D/B Ratio	Calculate to the nearest 0.1% at each binder content.

**f. Additives.** Provide Warm Mix Asphalt (WMA) additives or processes that comply with **SECTION 1207**. The Contractor is permitted to use WMA, unless otherwise shown in the Contract Documents.

For mixes containing Warm Mix Asphalt (WMA) additives, submit for the Engineer's review and approval, the additive or process used, the recommended rate of application, and the temperature ranges for mixing and compaction.

Mixing temperature range is provided by the Asphalt Binder Supplier. When using WMA, the mixing temperature may be reduced no more than 30°F for WMA water foaming processes, and no more than 70°F for WMA chemical and organic additives. The minimum mixing temperature for WMA is 220°F.

## 602.4 CONSTRUCTION REQUIREMENTS

**a. Plant Operation.** Adjust all plant operations to operate continuously.

(1) Preparation of the Asphalt Binder. Heat the asphalt binder to within a range as specified in **SECTION 601**. When heating the asphalt binder to the specified temperature, avoid local overheating. At all times, provide a continuous supply of the asphalt binder to the mixer at a uniform temperature. Asphalt binder received from the refinery at temperatures less than 375°F may be used as received, if the requirements regarding the reheating of asphalt binder in **SECTION 601** are met.

(a) Commingling of Asphalt Binders. Do not add or commingle asphalt binders from 2 or more sources into a storage tank. If this occurs, the contents of the storage tank are considered contaminated. Do not use the contents of the storage tank on the project, except as follows: It is permissible, at the Contractor's option, to thoroughly mix the contents of the tank and request sampling of the mixture. Submit the sample to the MRC for testing. Do not use the asphalt binder until approved, and when needed, a new mix design evaluation is completed.

(b) Asphalt Binder Sources. Before changing asphalt binder sources on a project, obtain approval from the DME. A new JMF may be required.

(c) Anti-Strip Additives. If liquid anti-strip additives are added at the Contractor's plant, install a "totalizer" to monitor the quantity of anti-strip additive being added. The Engineer may approve alternative methods for including anti-strip additives in a batch plant. If added at the plant, the anti-strip will be added in line with the asphalt binder as it is being transferred from the transit unit to the asphalt binder storage tank. Provide a method for the Engineer to monitor the percent of additive being added.

If hydrated lime is added, mix it in an approved pug mill to coat the combined aggregates. Moisten the combined virgin aggregate to a minimum of 3% above the saturated surface dry condition prior to, or during the addition of the hydrated lime.

(d) WMA Additives. If WMA additives are added at the Contractor's plant, install a "totalizer" to monitor the quantity of WMA additive being added. The Engineer may approve alternative methods for including chemical and organic WMA additives in a batch plant. If added at the plant, chemical and organic WMA additives will be added in line with the asphalt binder as it is being transferred from the transit unit to the asphalt binder storage tank. Provide a method for the Engineer to monitor the percent of additive being added.

(2) Preparation of Mineral Aggregate. When the mineral aggregate is composed of 2 or more ingredients, combine as shown in the approved JMF.

(a) Temperature Requirements. Dry the aggregate for the mixture and heat to a temperature to obtain an asphalt-aggregate mixture temperature immediately after mixing within the 75 to 150 second Saybolt viscosity range of the asphalt binder used. Obtain the temperature for this viscosity range from the MRC or the Asphalt Binder Producer. No mixing or compaction temperatures are to exceed 340°F without approval from the Field Materials Engineer. The minimum temperature may be revised by the DME provided it is demonstrated that satisfactory results may be obtained at a lower temperature. In such event, deliver the HMA to the paver at a temperature sufficient to allow the material to be satisfactorily placed and compacted to the specified density and surface tolerance requirements.

(3) Preparation of HMA. Introduce asphalt binder into the prepared aggregate in the proportionate amount determined by the  $P_{br}$  in the JMF.

(a) Basis of Rejection. HMA will be rejected if the aggregate, as it is discharged from the drum or the pugmill, contains sufficient moisture to cause foaming of the mixture, or if the temperature of the aggregate is such that the asphalt-aggregate mixture temperature is outside the range specified in **SECTION 601**.

(b) Mixing Time. Operate drum mixers at a rate to provide uniform aggregate coating in a continuous operation. For batch and continuous type plants, the minimum wet mixing time is 40 seconds. In all cases, mix a sufficient time to produce a uniform mixture in which all the aggregate particles are thoroughly coated. On batch plants, begin the timing at the start of the asphalt binder introduction into the pugmill, and end upon the opening of the discharge gate. For continuous flow plants, mixing time in seconds shall equal:

[pugmill dead capacity in pounds] divided by [pugmill output in pounds per second].

(c) Manufacturer's Specifications. Operate all drying, pumping and mixing equipment within the limits specified by the manufacturer, unless it can be demonstrated to the satisfaction of the Engineer that such limits may be exceeded without detriment to the HMA.

(d) Batcher Operation. Coordinate HMA batchers (Gob Hoppers) with the plant production rate at all times so the hopper is more than  $\frac{3}{4}$  full before the gates open, and the gates close before material can drop through the gob hopper directly into the surge bin, weigh hopper or truck.

(e) Wasted Material. Wasted material is not measured for pay.

If after an interruption of production, the drum-mixer contains cold, uncoated or otherwise unsuitable material, waste material through a diversion chute. In a continuous or batch plant drier, waste unsuitable material through the pugmill.

At the end of a production run, waste any segregated material in the cone of the storage bin.

(4) End of Day Quantities. At the end of each day of production provide the Engineer with a document signed by the Plant Foreman or the Project Manager listing the dry weight of each aggregate, mineral filler, RAP, RAS and WMA chemical or organic additive; the tons of asphalt binder, the tons of anti-strip agent used for the project during the day, and the tons of water used in the WMA foaming process. The dry weight is the tons of the material less the water content.

#### **b. Road Surface Preparation.**

(1) Preparation of Earth Subgrade. Do not place any surfacing material on any section, until the ditches and drains along that section are constructed to effectively drain the highway, and the base or subgrade is trimmed to the line, grade and typical cross-section as shown in the Contract Documents.

Do not deposit any material until the subgrade or base has been checked and approved by the Engineer.

Maintain the subgrade as prepared until it is covered with the base course. Repair any defects which may develop, at the Contractor's expense, to the satisfaction of the Engineer.

Protect the subgrade from damage when handling materials, tools and equipment. Do not store or stockpile materials on the subgrade. Do not place material or lay pavement on a frozen or muddy subgrade, or when it is raining or snowing.

Lightly spray the subgrade or base with water to obtain a thoroughly moistened condition when the HMA is deposited on it. Lightly scarify, where necessary. Do not puddle water on the grade. Disturb the originally compacted crust or top portion of the subgrade as little as possible.

(2) Preparation of an Existing Asphalt Pavement. Clean the surface to remove all foreign material and broom to remove dust. Excavate areas shown in the Contract Documents to be patched to a depth directed by the Engineer. Fill with HMA and compact.

(3) Preparation of an Existing Concrete or Brick Pavement. Clean all foreign material and broom to remove dust. Clean and fill cracks and joints, and construct surface leveling as shown in the Contract Documents.

(4) Tack Coat. Prior to placing the HMA, apply a tack coat to the existing surface, as shown in the Contract Documents. When warranted by weather conditions, the Engineer may authorize a change in the asphalt for tack coat. When such changes are made, the price per ton of material being used will be the unit price bid for the material designated in the contract plus or minus the difference in the invoice price per ton of the 2 materials at the refinery as determined at the time of application.

**c. Weighing Operations.** See SECTION 109 for details regarding weighing operations.

**d. Hauling Operations.** Schedule operations to minimize hauling over a surface course.

Deliver HMA to the paver at a temperature sufficient to allow the material to be placed and compacted to the specified density and surface tolerance.

**e. Paving Operations.** Except when placing SM-4.75A, SM-9.5A or SR-9.5A asphalt mixtures, remix the material transferred from the hauling unit, prior to placement. Use equipment such as a mobile conveyor, material transfer device, shuttle buggy material transfer vehicle, material transfer paver or paver with remixer conveyor system. After starting the project with the equipment listed above, and after producing HMA pavement density within the limits specified in TABLE 602-7, the Engineer will consider other types of equipment or modifications to pavers that will produce less segregation. The use of equipment as noted above shall not relieve the Contractor of the responsibility to comply with TABLE 602-7. The Engineer will check the pavement for longitudinal streaks and other irregularities. Make every effort to prevent or correct any irregularities in the pavement, such as changing pavers or using different and additional equipment.

Do not raise (dump) the wings of the paver receiving hopper at any time during the paving operation. The Engineer may waive this requirement if it is determined that raising (dumping) the wings will not produce detrimental segregation. If segregation or irregularities in the pavement surface or density are noted, review the plant, hauling and paving operations and take corrective action. The recommendations made in KDOT's "Segregation Check Points" should reduce the segregation and irregularities to an acceptable level. Copies of KDOT's "Segregation Check Points" may be obtained from the KDOT District Office or Field Engineer.

Spread the HMA and finish to the specified crown and grade using an automatically controlled HMA paver. Operate the paver at a speed to provide a uniform rate of placement without undue interruption. At all times, keep the paver hopper sufficiently full to prevent non-uniform flow of the HMA to the augers and screed.

If the automatic grade control devices break down, the Engineer may allow the paver to operate to the close of the working day, provided the surface is satisfactory. Do not operate the paver without working automatic control devices upon another lift that was laid without automatic controls.

(1) Surface Quality. Spread the HMA without tearing the surface. Strike a finish that is smooth, free of segregation, true to cross section, uniform in density and texture and free from surface irregularities. If the pavement does not comply with all of these requirements, plant production and paving will be suspended until the deficiency is corrected.

The Engineer will check segregation and uniformity of density using methods outlined in Section 5.8.3 - Segregation Check Using the Nuclear Density Gauge, Part V. For shoulders with a plan width of less than or equal to 3 feet, and placed at the same time as the traveled way, do not take nuclear density readings on the shoulder nor within 1 foot of the shoulder unless the pavement section is uniform across the entire roadway. The acceptable criteria for density uniformity are in TABLE 602-7.

TABLE 602-7: SEGREGATION AND UNIFORMITY OF DENSITY CHECK		
Mix Designation	Maximum Density Range (highest minus lowest)	Maximum Density Drop (average minus lowest)
All	4.4 lbs./cu. ft.	2.2 lbs./cu. ft.

Whenever the results from 2 consecutive density profiles fail to comply with both of the requirements listed in TABLE 602-7, plant production and paving will be suspended. Follow the procedures listed in the Profile Evaluation

Subsection of Section 5.8.3-Segregation Check Using the Nuclear Density Gauge, Part V until production may be resumed.

Joint density testing and the associated requirements listed below do not apply for HMA lift thicknesses less than or equal to 1 inch.

Evaluate the longitudinal joint density using methods outlined in Section 5.8.4-Joint Density Evaluation Using the Nuclear Density Gauge, Part V. Although it is the Contractor's responsibility to perform the joint density evaluation, the Engineer may make as many independent joint density verifications as deemed necessary at the random sample locations. The Engineer's results will be used for acceptance for joint density, whenever available. The acceptable criteria for joint density are in **TABLE 602-8**.

<b>TABLE 602-8: JOINT DENSITY REQUIREMENTS</b>	
<b>Nuclear Gauge Readings</b>	<b>Requirement</b>
Interior Density minus Joint Density	$\leq 3.0$ lbs./cu. ft.
OR	
Joint Density	$\geq 91.00\%$ of $G_{mm}$

If the results of 2 consecutive density profiles fail to comply with **TABLE 602-8**, the plant production and paving operations will be suspended. Follow the procedures listed in the Joint Evaluation Subsection of Section 5.8.4-Joint Density Evaluation Using the Nuclear Density Gauge, Part V, until production may be resumed.

(2) Leveling Courses. In general, spread leveling course mixtures by the method to produce the best results under prevailing conditions to secure a smooth base of uniform grade and cross section. The leveling course may be spread with a properly equipped paver or motor grader.

(3) Lift Thickness. Except for leveling courses or when shown otherwise in the Contract Documents, **TABLE 602-9** applies. The Engineer may adjust lift thickness to utilize the most efficient method of acquiring specified density and surface quality. The minimum lift thickness for any HMA mixture is 3 times the nominal maximum aggregate size, unless otherwise designated in the Contract Documents or approved by the Engineer.

<b>TABLE 602-9: NOMINAL COMPACTED THICKNESS</b>	
<b>Lift</b>	<b>Maximum Nominal Compacted Thickness</b>
Surface	2 inches
Base	4 inches

(4) Grade Control. Achieve grade control by use of 1 or more of the following grade reference devices. Approval of any of these devices will be based upon satisfactory performance.

(a) Traveling Stringline. Attach a traveling stringline or ski type attachment, a minimum length of 30 feet, to the paver and operate parallel with its line of travel.

(b) Reference Shoe. Attach a short reference shoe or joint matching device to the paver for control in matching surface grades along longitudinal joints.

(c) Erect Stringline. Use an erected stringline consisting of a tightly stretched wire or string offset from and parallel to the pavement edge on 1 or both sides. Erect the stringline parallel to the established pavement surface grade and support at intervals as necessary to maintain the established grade and alignment.

(d) Stringless Paving. Control line, grade and pavement cross-section as shown in the Contract Documents. Use electronic guidance systems that meet the requirements and tolerances listed in **SECTION 802**. Horizontal control is guided by GPS. Vertical control is guided by Total Stations. GPS will not be allowed for Vertical control.

When paving on a fresh subgrade that has not been trimmed by an automatically controlled machine, use an erected stringline or stringless paving to establish grade. Use either of these options on the first or second lift. When directed by the Engineer, use an erected stringline or stringless paving to match grade control points such as bridges.

(5) Compaction of Mixtures. Uniformly compact the HMA as soon after spreading and strike-off as possible without shoving or tearing. Use self-propelled rollers operated at speeds slow enough to avoid displacement of the HMA. Equipment and rolling procedures which result in excessive crushing of the aggregate are prohibited. Use a sufficient number and weight of rollers to compact the HMA to the required density, using a minimum of 2 rollers. If the hot mix plant is operating at over 275 tons per hour, use a minimum of 3 rollers. See **subsections 602.4e.(6)** for

exceptions to the minimum number of rollers. Perform final rolling with a steel roller unless otherwise specified. On the final pass, operate finish rollers in the static or oscillating mode.

Coordinate the frequency, amplitude and forward speed of the vibratory roller to achieve satisfactory compaction without objectionable undulations. For HMA lifts with a compacted thickness less than 1¼ inch, operate vibratory rollers in the static mode.

Keep rollers in operation as necessary so all parts of the pavement receive substantially equal compaction at the proper time. The Engineer will suspend HMA delivery to the project at any time proper compaction is not being performed.

Remove, replace with suitable material and finish according to these specifications any mixture that becomes loose, broken, mixed with foreign material or which does not comply in all respects with the specifications.

(6) Density Requirements.

(a) For mixes with a specified thickness greater than or equal to 1 ½ inches:

For lots 1 and 2, control density as shown in **subsection 602.4e.(6)(b)**. Before beginning production, the Contractor has the option to accept the pay adjustment for density on both Lots 1 and 2, or only Lot 2. If the Contractor chooses to accept the pay adjustments for density on both Lots 1 and 2, or only Lot 2, control the density as shown in **subsections 602.4e.(6)(a)(i-ii)**. If the Contractor chooses to accept pay adjustment for density on Lot 1, the pay adjustment can not be rejected on Lot 2.

(i) HMA Overlay. For lots 3 and greater, the lot density requirements and appropriate density pay adjustment factors are shown in **subsection 602.9b**, as the percent of the  $G_{mm}$  value based on the average of the density tests. The standard lot size is 10 density tests. Smaller lot sizes may result as outlined in **TABLE 602-10**. Normally, the  $G_{mm}$  value used to calculate the density percentage is the average value of all  $G_{mm}$  tests conducted the same day the lot was placed and compacted. If less than 3  $G_{mm}$  values were obtained that day, use the moving average value (last 4 tests prior to the end of the day). When starting a mix and less than 4  $G_{mm}$  values have been determined, use the average value of those available at the end of each day.

(ii) HMA Surface, HMA Base and HMA Pavement. For lots 3 and greater, the lower specification limit (LSL) value for density is given in **subsection 602.9c**, along with the appropriate density pay adjustment factor equations. The LSL value is given as a percentage of  $G_{mm}$ . Lot density is determined using the measured density values for all sublots in a lot. The standard lot size is 10 density tests. Smaller lot sizes may result as outlined in **TABLE 602-10**. Normally, the  $G_{mm}$  value used to calculate the density percentage is the average value of all  $G_{mm}$  tests conducted the same day the lot was placed and compacted. If less than 3  $G_{mm}$  values were obtained that day, use the moving average value (last 4 tests prior to the end of the day). When starting a mix and less than 4  $G_{mm}$  values have been determined, use the average value of those available at the end of each day.

(b) For mixes with a specified thickness less than 1½ inches:

These mixes will not have a density pay adjustment. Control density using an approved rolling procedure with random nuclear gauge density determinations. Include a method for controlling density in the QCP.

Designate a "Compaction Foreman". This person shall control compaction procedures, review nuclear gauge results as they are obtained, adjust compaction procedures as needed to optimize compaction and report any changes in the compaction process and results of nuclear gauge testing to the Engineer. The compaction foreman may also be the nuclear gauge operator. The nuclear gauge operator shall continuously monitor compaction procedures. As a minimum, take 10 random nuclear gauge density determinations per day and report results to the Engineer. Throughout the day, nuclear gauge results shall be available for review by the Engineer. The compaction foreman shall document at a minimum of once every 2 hours that the approved rolling sequence is being followed. Documentation includes roller passes, the mat temperature at each pass, amplitude setting of rollers and roller speed. Provide the documentation to the Engineer.

Determine and periodically update an approved rolling procedure, as outlined in this section. As a minimum, evaluate the initial rolling procedure using 3 rollers. If the hot mix plant is operating at over 275 tons per hour, use a minimum of 4 rollers in the initial evaluation. Operate vibratory rollers according to **SECTION 151**. Evaluate HMA paver screed operation with the nuclear gauge at various vibration settings. For screed evaluation, take the nuclear gauge readings directly behind the screed and before rolling. The Compaction Foreman and Engineer will evaluate the densities

obtained with the various roller combinations and screed settings to determine the initial approved rolling procedure.

Together, the Compaction Foreman and Engineer will determine when new rolling procedures are required. HMA production may be stopped by the Compaction Foreman or Engineer whenever rolling is not being performed according to the approved rolling procedure.

(c) For all lots, achieve the maximum density before the temperature of the HMA falls below 175°F. When using WMA, achieve the maximum density before the temperature of the WMA falls below 165°F. Do not crush the aggregate. When the mat temperature falls below 175°F or 165°F for WMA, roller marks may be removed from the mat with a self-propelled static steel roller or an oscillating roller operating in either the static mode or in the oscillating mode.

<b>TABLE 602-10: DAILY PRODUCTION VS NUMBER OF SUBLOTS AND TEST REQUIREMENTS</b>			
<b>Daily Production (tons)</b>	<b>Number of Sublots</b>	<b>No. of Cores or Nuclear Density Tests**</b>	<b>No. of Verification Cores or Nuclear Density Tests**</b>
0-599	3*	6*	3*
600-999	4*	8*	4*
1000 or more	5	10	5

\*Minimum number for mixes with a specified thickness of 1½ inches or greater: The Contractor may choose to obtain the number required for 1000 or more tons. If the Contractor chooses to test 5 sublots (10 tests), KDOT will obtain 5 verification tests.

\*\*For mixes with a specified thickness less than 1½ inch: Verification testing may be performed, but is not required. Additional testing may be performed by the Contractor. A minimum of 10 tests are required.

(7) Contact Surfaces. Coat contact surfaces of curbing, gutters, manholes and similar structures with a thin uniform coating of asphalt material. Place the HMA uniformly high near the contact surfaces so that after compaction it shall be approximately ¼ inch above the edge of such structures.

(8) Adjustment of Manholes (Set Price). When required, this work will be performed and paid for under **SECTION 816.**

(9) Construction Joints.

(a) Transverse Construction Joints. Use a method of making transverse construction joints to provide a thorough and continuous bond, provide an acceptable surface texture and meet density requirements. Do not vary the surface elevation more than 3/16 inch in 10 feet, when tested longitudinally across the joint. When required, repair the joints or paving operations will be suspended.

(b) Longitudinal Joints. Construct well bonded and sealed longitudinal joints to obtain maximum compaction at the joint. If deemed necessary by the Engineer to properly seal the joint, apply a light coat of asphalt emulsion or asphalt binder to the exposed edge before the joint is made.

Before placing the fresh HMA against a cut joint or against old pavement, spray or paint the contact surface with a thin uniform coat of asphalt emulsion or asphalt binder. Where a finishing machine is used, make the longitudinal joint by depositing a sufficient amount of HMA to form a smooth and tight joint.

Offset the longitudinal joint in successive courses by 6 to 12 inches. Comply with traffic lane edges for the width of the surface of top course placement.

(10) Shoulder Surfacing and Widening. When the placement width of shoulders or uniform width widenings is less than can be accomplished with a regular paver, spread each course with a mechanical spreading device.

(11) Rumble Strips. When designated, construct rumble strips according to the Contract Documents.

**f. Treatment of Adjacent Areas.** Pave sideroads, entrances and turnouts for mailboxes as shown in the Contract Documents. Overlay all widening areas designated in the Contract Documents or ordered by the Engineer.

**g. Pavement Smoothness.** Evaluate pavement smoothness according to **SECTION 603** and the following:

<b>TABLE 602-11: MAXIMUM VARIATION OF THE SURFACE</b>	
<b>Length (feet)</b>	<b>Maximum Variation of the Surface (inches)</b>
10	3/16
25	5/16

Correct all humps or depressions exceeding the specified tolerance by removing the defective work and overlaying with new material, or by other means approved by the Engineer. All necessary corrections are at the Contractor's expense.

### 602.5 PROCESS CONTROL

**a. General.** Establish gradation limits and proportions for each individual aggregate, mineral filler and RAP and RAS, when applicable. Specify the limits and proportions such that the material produced complies with the applicable requirements of the designated mix type. The Contractor is responsible for all process control operations including testing. At no time will KDOT's representative issue instructions to the Contractor or producer as to setting of dials, gauges, scales and meters. KDOT will collect and test verification samples and assurance samples and inspect the Contractor's quality control operations.

**b. JMF Adjustments.** Produce a mixture of uniform composition closely complying with approved design JMF to obtain the specified properties when compacted. If, during production, results from quality control tests demonstrate a need to make adjustments to the mix design, then make adjustments to the design JMF single point gradation and binder content to achieve the specified properties. The JMF adjustments shall produce a mix that complies with **TABLE 602-1** for the specified mix designation. When necessary, adjust on a subplot basis. Report the new JMF to KDOT's field representative and the DME before making such changes, and submit a new mix design for review and approval if required by the DME.

**c. Specification Working Ranges.** Establish acceptable limits for field test results by applying the tolerances shown in **TABLE 602-12** to the JMF or adjusted JMF for binder content. Establish acceptable limits for the other listed mix characteristics by applying the tolerances shown in **TABLE 602-12** to the requirements of **TABLE 602-1**.

<b>TABLE 602-12: SPECIFICATION WORKING RANGES (QC/QA)</b>				
<b>Mix Characteristic</b>	<b>Tolerance from JMF</b>			
	<b>Single Test Value</b>	<b>Plot</b>	<b>4 Point Moving Average Value</b>	<b>Plot</b>
Binder Content	±0.6%	*	±0.3%	*
<b>Mix Characteristic</b>	<b>Tolerance for Specification Limits</b>			
	<b>Single Test Value</b>	<b>Plot</b>	<b>4 Point Moving Average Value</b>	<b>Plot</b>
Gradation (applicable sieves in <b>TABLE 602-1</b> )	N/A	*	zero tolerance	*
Air Voids @ N <sub>des</sub> gyrations	-1.0%, +1.5%	*	N/A	
Voids in Mineral Aggregate (VMA)	1.0% below min.	*	zero tolerance	*
Voids Filled with Asphalt (VFA)	N/A		zero tolerance	*
Course Aggregate Angularity (CAA)	zero tolerance		N/A	
Sand Equivalent (SE)	zero tolerance		N/A	
Fine Aggregate Uncompacted Voids (FAA)	zero tolerance		N/A	
%Tensile Strength Ratio (%TSR)	zero tolerance	*	N/A	
Density @ N <sub>ini</sub> and N <sub>max</sub>	N/A		zero tolerance	
Dust to Effective Binder (D/B) Ratio	zero tolerance	*	zero tolerance	*

\* Plot data according to **subsection 106.4**.

For gradations, as a minimum, plot the No. 4, 8, 30 and 200 sieves.

Plot  $G_{mm}$  to third decimal point.

Indicate Job Mix Formula (JMF) and specification working range limits for single test results on the control charts using a green ink dotted line.

Indicate the specification working range limits for the 4-point moving average results with a green ink solid line.

**d. Mixes with Reclaimed Asphalt Pavement (RAP).** The intent of this section is to prevent more RAP going into a mix than is allowed in the Contract Documents. Totalizers are used to determine the %RAP in a mix; however, this does not preclude the Engineer from using other methods for determining the %RAP in a mix.

Provide the Engineer with the totalizer readings at the end of each day of production. These shall include the final daily readings for the RAP, virgin aggregates and asphalt binder.

The %RAP will be checked a minimum of twice a day by the Engineer. The readings will be taken a minimum of 2 hours apart and a maximum of 6 hours apart. The readings will not be taken within the first hour of start-up as adjustments to the plant are most frequent within this time frame.

Calculate RAP percentages using the plant totalizers for the virgin aggregates ( $AGG_v$ ), and the RAP as follows:

$$\text{Equation A: } \%RAP = \frac{RAP * 100}{RAP + AGG_v}$$

%RAP is the percent RAP in the total aggregates (Virgin and RAP) rounded to the nearest tenth.

RAP is the difference between the current and last reading of the RAP totalizer in tons.

$AGG_v$  is the difference between the current and last reading of the Virgin Aggregate totalizer in tons.

%RAP is considered out of compliance when any of the following occurs:

- Any single test exceeds the maximum percentage allowed by specs by more than 3.0%.
- The 4-point moving average exceeds the maximum percentage allowed by specifications.

Actions to be taken if the %RAP is out of compliance:

- If any single test exceeds the maximum allowed %RAP by more than 3.0% stop production, perform the “0 check run” on the belts in the presence of the Engineer, and make adjustments to correct the discrepancy.
- If the 4-point moving average exceeds the maximum allowed %RAP three consecutive times, stop production, perform the “0 check run” on the belts in the presence of the Engineer, and make adjustments to correct the discrepancy.
- If the 4-point moving average exceeds the maximum allowed %RAP by more than 1.0% then the Contractor will be assessed the following penalty.

$$\text{Equation B: } \text{Recycled Asphalt Materials Deduct} = \frac{BP * Q * (\%RAP_4 - \%RAP_{\max})}{100}$$

Recycled Asphalt Materials Deduct is the Dollar amount to be subtracted from the contract.

BP is the Bid Price of the mix.

Q is the Quantity, in tons, of material represented by the 4-point moving average. This value shall be based on the weigh tickets taken from the time of the 1<sup>st</sup> test of the 4-point moving average through the time of 4<sup>th</sup> test.

$\%RAP_4$  is the 4-point moving average of %RAP.

$\%RAP_{\max}$  is the Maximum %RAP from the Project Special Provision.

Recycled Asphalt Materials Deduct for RAP will be an item added to the contract.

Any time production is stopped due to non-compliant %RAP, restart the 4-point moving average provided the belt had the “0 check run” performed in the presence of the Engineer, and adjustments were made to the mix proportioning to correct previous discrepancies. The initial start-up at the beginning of each work day does not constitute a stop in production due to non-compliant %RAP.

If at any time the Contractor chooses to stop production in order to correct discrepancies in the mix proportioning concerning the %RAP, the most recent data (not to exceed 4 points) will be averaged. If the average

exceeds the maximum allowed %RAP by more than 1% then a Recycled Asphalt Materials Deduct will be assessed as calculated above with the following substitutions:

In the case where less than 4-points are available for the 4-point moving average, the most recent test is substituted for the 4<sup>th</sup> test, and the %RAP<sub>4</sub> may be a single test, a 2-point moving average or a 3-point moving average.

**e. Mixes with RAP and RAS.** The intent of this section is to prevent more RAP or RAS going into a mix than is allowed in the Contract Documents. Totalizers are used to determine the %RAP and %RAS in a mix; however, this does not preclude the Engineer from using other methods for determining the %RAP and %RAS in a mix.

Provide the Engineer with the totalizer readings at the end of each day of production. These shall include the final daily readings for the RAP, RAS, virgin aggregates and asphalt binder. Readings for the RAP and RAS may be obtained from individual RAP and RAS measurements or may be calculated from measurements on the combined recycled material and either the RAP or RAS.

The %RAP and %RAS will be checked a minimum of twice a day by the Engineer. The readings will be taken a minimum of 2 hours apart and a maximum of 6 hours apart. The readings will not be taken within the first hour of start-up as adjustments to the plant are most frequent within this time frame.

Calculate RAP percentages using the plant totalizers for the virgin aggregates (AGG<sub>v</sub>), RAP and RAS as follows:

$$\text{Equation C:} \quad \%RAP = \frac{RAP * 100}{RAP + RAS + AGG_v}$$

%RAP is the percent RAP in the total aggregates (Virgin, RAP and RAS) rounded to the nearest tenth.

RAP is the difference between the current and last reading of the RAP totalizer in tons.

RAS is the difference between the current and last reading of the RAS totalizer in tons.

AGG<sub>v</sub> is the difference between the current and last reading of the Virgin Aggregate totalizer in tons.

%RAP is considered out of compliance when any of the following occurs:

- Any single test exceeds the target percentage in the JMF by more than 2.0%.
- The 4-point moving average exceeds the target percentage in the JMF.

Actions to be taken if the %RAP is out of compliance:

- If any single test exceeds the target %RAP in the JMF by more than 2.0% stop production, perform the "0 check run" on the belts in the presence of the Engineer, and make adjustments to correct the discrepancy.
- If the 4-point moving average exceeds the target %RAP in the JMF three consecutive times, stop production, perform the "0 check run" on the belts in the presence of the Engineer, and make adjustments to correct the discrepancy.
- If the 4-point moving average exceeds the target %RAP in the JMF by more than 1.0% then the Contractor will be assessed the following penalty.

$$\text{Equation D:} \quad \text{Recycled Asphalt Materials Deduct} = \frac{BP * Q * (\%RAP_4 - \%RAP_{\max})}{100}$$

Recycled Asphalt Materials Deduct is the Dollar amount to be subtracted from the contract.

BP is the Bid Price of the mix.

Q is the Quantity, in tons, of material represented by the 4-point moving average. This value shall be based on the weigh tickets taken from the time of the 1<sup>st</sup> test of the 4-point moving average through the time of 4<sup>th</sup> test.

%RAP<sub>4</sub> is the 4-point moving average of %RAP.

%RAP<sub>max</sub> is the target %RAP in the JMF.

Calculate RAS percentages using the plant totalizers for the virgin aggregates (AGG<sub>v</sub>), RAP and RAS as follows:

$$\text{Equation E:} \quad \%RAS = \frac{RAS * 100}{RAP + RAS + AGG_v}$$

%RAS is the percent RAS in the total aggregates (Virgin, RAP and RAS) rounded to the nearest tenth.  
RAP is the difference between the current and last reading of the RAP totalizer in tons.  
RAS is the difference between the current and last reading of the RAS totalizer in tons.  
AGG<sub>v</sub> is the difference between the current and last reading of the Virgin Aggregate totalizer in tons.

%RAS is considered out of compliance when any of the following occurs:

- Any single test exceeds the target percentage in the JMF more than 1.0%.
- The 4-point moving average exceeds the target percentage in the JMF.

Actions to be taken if the %RAS is out of compliance:

- If any single test exceeds the target %RAS in the JMF by more than 1.0% stop production, perform the “0 check run” on the belts in the presence of the Engineer, and make adjustments to correct the discrepancy.
- If the 4-point moving average exceeds the target %RAS in the JMF three consecutive times, stop production, perform the “0 check run” on the belts in the presence of the Engineer, and make adjustments to correct the discrepancy.
- If the 4-point moving average exceeds the target %RAS in the JMF by more than 0.5% then the Contractor will be assessed the following penalty.

**Equation F:** Recycled Asphalt Materials Deduct = 
$$\frac{BP * Q * 4 * (\%RAS_4 - \%RAS_{max})}{100}$$

Recycled Asphalt Materials Deduct is the Dollar amount to be subtracted from the contract.

BP is the Bid Price of the mix.

Q is the Quantity, in tons, of material represented by the 4-point moving average. This value shall be based on the weigh tickets taken from the time of the 1<sup>st</sup> test of the 4-point moving average through the time of 4<sup>th</sup> test.

%RAS<sub>4</sub> is the 4-point moving average of %RAS.

%RAS<sub>max</sub> is the target %RAS in the JMF.

Recycled Asphalt Materials Deduct for RAP or RAS will be an item added to the contract.

Any time production is stopped due to non-compliant %RAP or %RAS, restart both 4-point moving averages provided the belt had the “0 check run” performed in the presence of the Engineer, and adjustments were made to the mix proportioning to correct previous discrepancies. The initial start-up at the beginning of each work day does not constitute a stop in production due to non-compliant %RAP or %RAS.

If at any time the Contractor chooses to stop production in order to correct discrepancies in the mix proportioning concerning the %RAP or %RAS, the most recent data (not to exceed 4 points) will be averaged. If the average exceeds the target %RAP in the JMF by more than 1.0% or exceeds the target %RAS in the JMF by more than 0.5% then a Recycled Asphalt Materials Deduct will be assessed as calculated above with the following substitutions:

In the case where less than 4-points are available for the 4-point moving average, the most recent test is substituted for the 4<sup>th</sup> test, and the %RAP<sub>4</sub> or %RAS<sub>4</sub> may be a single test, a 2-point moving average or a 3-point moving average.

## 602.6 COMPACTION TESTING

**a. General.** Make the density determination of the compacted mixture using test results on random samples selected by the Contractor or Engineer (see **subsection 602.2i.(1)**) from each lift placed. Select sites according to the approved QCP. Take the nuclear density tests or core samples before placement of the next lift and before opening to construction or public traffic, and no later than the next working day following the date of placement.

Exception to coring after any traffic on the overlay. Do not use this procedure more than twice on any one project or tied projects, unless approved by the Engineer. The Contractor may request re-evaluation by coring.

(Testing and coring shall be subsidiary items.) When coring is requested, follow these procedures for the lot under re-evaluation.

(1) Immediately prior to coring, determine nuclear gauge densities in the presence of the Engineer in the locations previously tested. The average nuclear gauge density after traffic will be determined. A Contractor density correction factor will be calculated as follows: the average nuclear gauge density after traffic minus the average nuclear gauge density before traffic. If the calculated Contractor density correction factor is a negative value, the Contractor's density correction factor will be set equal to zero (normally the density correction factor will be a positive number).

(2) Immediately before coring, nuclear gauge densities will be determined by the Engineer in the presence of the Contractor in the locations previously tested. The average nuclear density after traffic will be determined. A KDOT density correction factor will be calculated as follows, the average nuclear gauge density after traffic minus the average nuclear gauge density before traffic. If the calculated KDOT density correction factor is a negative number, KDOT's density correction factor will be set equal to zero.

(3) Determine the Traffic Density Correction Factor. It will be the larger of the Contractor's density correction factor or KDOT's density correction factor determined in **subsections 602.6a.(1) and (2)**.

(4) With the Engineer present, obtain 1 core from each of the Contractor and KDOT nuclear gauge locations. Mark each core as they are taken. Take the cores to KDOT's field laboratory for drying and evaluation. Together, the Contractor and Engineer will determine the density of each core. Determine the corrected core density for each Contractor and KDOT core as follows: the core density minus the Traffic Density Correction Factor.

(5) Using the corrected Contractor core densities and the corrected KDOT core densities, the Engineer will re-evaluate this lot using the procedures outlined in **subsection 602.9**. Based on this re-evaluation, the Engineer will inform the Contractor of the lots disposition and density pay adjustment factor.

For shoulders with a plan width of less than or equal to 3 feet and placed at the same time as the traveled way, the density pay adjustment factors for the traveled way applies. Acceptance of or pay adjustment for density on all shoulders with a plan width greater than 3 feet and any shoulder not placed at the same time as the traveled way shall be according to **subsection 602.9**.

A lot consists of a day's production for each lift placed and contains the number of density locations as outlined in **TABLE 602-10**. Base lot acceptance on 2 test results from each subplot unless the Engineer's results (1 test per subplot) are used.  $V_a$  lots and density lots are normally of different sizes.

If the lane being placed is to be opened to traffic that day, the Engineer and the Contractor may predetermine the subplot size based on anticipated production. If actual production does not meet anticipated production, the subplot size will be adjusted. The number of tests shall be as outlined in **TABLE 602-10**.

The minimum number of density tests is as listed in **TABLE 602-10**. The Contractor has the option to take additional tests to provide 10 test results to determine payment. The density pay adjustment factors are computed using formulas in **subsection 602.9**. The density pay adjustment factors do not apply to sideroads, entrances, crossovers and other incidental surfacing.

**b. Nuclear Density Tests (For mixes with a specified thickness of 1½ inches or greater.).** Take 2 nuclear density tests at random within each subplot. The Engineer will take 1 random nuclear density verification test per subplot. Perform nuclear density testing to be used in the determination of the traveled way pay adjustment factors and control of shoulder density. Do not take nuclear gauge readings within 1 foot of a longitudinal joint or edge, nor within 20 feet of a transverse joint. For shoulders with a plan width of less than or equal to 3 feet, and placed at the same time as the traveled way, do not take nuclear density readings on the shoulder nor within 1 foot of the shoulder unless the pavement section is uniform across the entire roadway. Mark the outline of the nuclear gauge on the pavement at each location tested with a method of marking that shall last a minimum of 24 hours. Take the nuclear density test at the random location. Do not move the gauge from this location to maximize or minimize the density results. If the Contractor doubts the accuracy of any of the nuclear density test results, the pavement may be cored at the nuclear gauge test locations. If coring is chosen to determine the density for pay adjustment purposes, then all nuclear density test results representing the lot shall be voided and cores taken as prescribed in **subsection 602.6c**.

Take verification nuclear density tests, 1 per subplot, at random locations selected by the Engineer. Payment factors will be based on the Contractor's nuclear density test results, provided those results are validated by KDOT's nuclear density tests.

The Engineer will determine a calibration factor for the Contractor's nuclear density device at the same time as a calibration factor is determined for KDOT's device. The Contractor will be afforded the opportunity to observe the calibration procedure whether it is performed at the district laboratory or on the project site. The Engineer should provide calibration factors by the end of the working day following the date of collecting the cores. In cases where this is not possible, the Contractor and the Engineer may agree in advance to accept a zero pay adjustment for the concerned lots.

The Engineer and Contractor will compare nuclear density test results before any traffic is allowed on the roadway. If the Contractor or KDOT density values are suspect, the Engineer may approve re-testing the locations in question. When re-testing is approved, substitute the new nuclear density values for the values in question. Before traffic is allowed on the roadway, the Contractor needs to determine if cores will be taken.

**c. Cores (For mixes with a specified thickness of 1½ inches or greater.)** Take 2 cores at random locations within each subplot. It may be necessary to chill the compacted mixture before coring so that the samples may be removed intact without distortion. Cut the samples using a 4-inch coring device, unless a 6-inch coring device is approved by the Engineer. Mark all samples with the lot number, subplot number and core number.

Transport the cores to the laboratory as soon as possible to prevent damage due to improper handling or exposure to heat. Cut all cores including the Engineer's verification cores. The Contractor will be paid only for cores cut to calibrate the nuclear gauge, when requested by the Engineer. Use KT-15 Procedure III to determine core density.

Do not take cores within 1 foot of a longitudinal joint or edge, nor within 20 feet of a transverse joint. For shoulders with a plan width of less than or equal to 3 feet, and placed at the same time as the traveled way, do not take cores on the shoulder nor within 1 foot of the shoulder unless the pavement section is uniform across the entire roadway.

Take 1 verification core per subplot (at locations selected by the Engineer) for testing at KDOT's laboratory. Density pay adjustment factors and control of shoulder density are based on the core results, provided those results are validated by the verification cores sent to KDOT's laboratory.

Dry the core holes, tack the sides and bottom, fill with the same type of material and properly compact it by the next working day.

## 602.7 WEATHER LIMITATIONS

Do not place HMA on any wet or frozen surface or when weather conditions otherwise prevent the proper handling and finishing of the mixture.

Only place HMA when either the minimum ambient air temperature or the road surface temperature shown in **TABLE 602-13** is met.

<b>TABLE 602-13: MINIMUM HMA PLACEMENT TEMPERATURES</b>							
<b>Paving Course</b>	<b>Thickness (inches)</b>	<b>Air Temperature (°F)</b>			<b>Surface Temperature (°F)</b>		
		<b>HMA</b>	<b>WMA Foam</b>	<b>WMA Chem</b>	<b>HMA</b>	<b>WMA Foam</b>	<b>WMA Chem</b>
Surface	All	50	45	40	55	50	45
Subsurface	<1.5	50	45	40	55	50	45
Subsurface	≥1.5 and < 3	40	35	30	45	40	35
Subsurface	≥ 3	30	30	30	35	32	32

## 602.8 MIXTURE ACCEPTANCE

**a. General.** Test each mix designation at each plant for compliance with **TABLE 602-1**. Acceptance will be made on a lot by lot basis contingent upon satisfactory test results. Obtain test samples of the mix designation from the roadway behind the paving operation before compaction. The sampling device and procedures used to obtain the samples must be approved by the Engineer. Use KT-25 for obtaining HMA from the roadway and splitting of the sample. The Contractor's quality control tests will be used for acceptance provided those results are verified by KDOT.

A load or loads of mixture which, in the opinion of the Engineer, are unacceptable for reasons such as being segregated, aggregate being improperly coated, foaming aggregate or being outside the mixing temperature range may be rejected. Verification samples will be taken by the Engineer at randomly selected locations from behind the paver. Fill all sample locations before compaction.

The  $V_a$  test values will also be used to determine  $V_a$  pay adjustments according to **subsection 602.9d**.  $V_a$  pay adjustments apply to the HMA placed on the traveled way and shoulders (including ramps and acceleration and deceleration lanes).

**b. Lot Definition for Mix Production Sampling and Testing.** A lot is defined as an isolated quantity of a specified material produced from a single source or operation. Each lot shall normally be represented by 4 contiguous test results. A lot may be represented by test results on samples taken from 1 or more day's production.

**c. Lot Investigation.** The Engineer may examine materials represented by individual test results which lie beyond the Contractor's normal quality control testing variation. The investigation may be based on either Contractor or KDOT test results. The information from additional testing (including testing of in-place HMA) may be used to define unacceptable work according to **SECTION 105**. The Engineer may apply appropriate price reductions or initiate corrective action.

For any test, if a dispute exists between the Engineer and Contractor about the validity of the other's test results, the KDOT District Materials Laboratory or the MRC will perform referee testing, except for nuclear density dispute resolution and  $V_a$  dispute resolution. If the disputed KDOT test results were generated at the District Laboratory, the MRC will perform the referee tests. If the disputed KDOT test result was generated at the MRC, an independent laboratory agreeable to both parties will be selected. The Laboratory shall be accredited by the AASHTO Accreditation Program in the appropriate testing category.

If referee testing indicates that KDOT test results are correct, the Contractor pays for the additional testing, including referee testing performed at the MRC. This will be paid using the bid item Contract Deduct which will be an item added to the contract.

If the referee testing indicates that Contractor test results are correct, KDOT pays for the additional testing. Pay the independent lab for the testing and submit the paid invoice to KDOT. The Engineer will reimburse the Contractor (based on the invoice price) as Extra Work, **SECTION 104**.

(1) For nuclear density dispute resolution (the statistical comparison fails and the Contractor questions KDOT's results), the following procedure applies:

- Discard pay factors previously established with the nuclear gauge, and use the core results to establish the pay factors.
- With the Engineer present, take 1 core from each of the locations previously tested with the Contractor's nuclear gauge and KDOT's nuclear gauge (normally 15 cores). Mark all cores with the lot number, subplot number and core number.
- Take the cores to the field laboratory and dry to a constant weight before testing. The Contractor and the Engineer, working together, will determine the core densities (KT-15, Procedure III).
- A statistical comparison will be made between Contractor and KDOT core results. If the t-test passes, KDOT will pay for all cores. The Contractor's test results will be used to calculate the density pay factors. If the t-test fails, KDOT will not pay for the cores. KDOT test results will be used to calculate the density pay factors.

(2) For  $V_a$  dispute resolution (the statistical comparison fails and the Contractor questions KDOT results), the following procedure applies for the lots in question:

- Determine which lots to dispute. Only dispute the lot produced immediately prior to the lot currently under production and being tested. Notify the Engineer, prior to the completion of all Contractor  $V_a$  testing for this lot. (When production is completed for any mix, the last lot may be challenged the day production is completed). When the hot mix plant shuts down for the winter, the Contractor has a maximum of 7 calendar days to dispute the last lot produced prior to winter shut down.
- Discard  $V_a$  and  $V_a$  pay adjustment factors previously determined within the lots being questioned.
- All saved gyratory compacted  $V_a$  quality control and verification samples and back half of samples within the lots in question will be taken by KDOT to the District Materials Laboratory. All back half of samples shall be a minimum of 35 pounds. Failing to obtain enough material removes the right to dispute resolution. Copies of all paperwork, including work sheets, associated with previous  $V_a$  calculations for the disputed lots will also be taken to the District Materials Laboratory.

The following retesting will be completed by KDOT:

- Check the samples to be sure they are dry before retesting. Reweigh the original gyratory compacted  $V_a$  quality control and verification samples. Determine the  $G_{mb}$  at  $N_{des}$  revolutions for all saved gyratory plugs. Compare retest results with original test results. Use this information to isolate potential testing errors, but continue with the remainder of the retesting steps.

- Determine the  $G_{mm}$  using the back half of all samples within each lot being questioned. Normally, there will be 5 back halves (4 Contractor's and 1 KDOT) to test within each lot.
- Compact the back halves to  $N_{max}$  revolutions and determine the  $G_{mb}$  at  $N_{des}$  revolutions.
- Use  $G_{mm}$  determined above and the  $G_{mb}$  determined from the recompacted samples to calculate  $V_a$  at  $N_{des}$  revolutions for the lots in question.
- Using the retest  $V_a$  results, a statistical comparison will be made. If the t-test passes, the Contractor's retest results will be used to calculate the pay factor and KDOT will pay for all retesting. Use the procedures shown in **subsection 602.9d**. If the t-test fails, KDOT's retest results will be used to calculate the pay factor, and the Contractor will pay for all retesting.

**d. Resampling of Lots.** Take no samples for retest for pay adjustment purposes except as noted in **subsections 602.6b.** and **602.8c.**

**e. Multiple Projects.** If multiple projects are supplied from 1 or more plants using the same mix, carry over the lots at each hot mix plant from project to project.

**f. Lot Size.** A standard size mix production lot (density test lots are defined in **subsection 602.6a.(5)**) consists of 4 equal sublots of 750 tons each of HMA (lot size is 3,000 tons).

It is anticipated that lot size shall be as specified. However, with the Engineer's approval, the Contractor may re-define lot size for reasons such as, but not limited to, change in contract quantities or interruption of the work. Take 1 sample during production of each subplot and utilize it to determine disposition of the lot in which it occurs.

**g. Increased Lot Size.** After 8 consecutive sublots have been produced within the tolerances shown for all mix characteristics listed in **TABLE 602-12** and without a  $V_a$  penalty, the subplot size may be increased to 1,000 tons (lot size of 4,000 tons), provided the normal production rate of the plant is greater than 250 tons per hour. Provide immediate notification of lot size changes to the Engineer any time a change is made.

After 8 additional consecutive sublots have been produced at the 1,000 ton subplot size, the subplot size may again be increased to 1,250 tons per subplot (lot size of 5,000 tons), provided all 8 consecutive 1,000 ton sublots have been produced within the tolerances shown for all mix characteristics listed in **TABLE 602-12**, without a  $V_a$  penalty, production rates for the previous 2 days have been greater than 3,750 tons per day, and a minimum of 2 of the last 3 segregation profile checks comply with **TABLE 602-14**.

<b>TABLE 602-14: SEGREGATION PROFILE CHECKS FOR INCREASED SUBLOT SIZE</b>		
<b>Mix Designation</b>	<b>Maximum Density Range (highest minus lowest)</b>	<b>Maximum Density Drop (average minus lowest)</b>
All	3.1 lbs./cu. ft.	1.9 lbs./cu. ft.

If subsequent test results fall outside the tolerances shown for any mix characteristic listed in **TABLE 602-12** or a  $V_a$  penalty is incurred, decrease the subplot size to 750 tons. If the production rates fall below 3,750 tons per day for 2 consecutive days or a minimum of 2 of the last 3 segregation profile checks fail the above requirements, then reduce the 1,250 ton sublots size to 1,000 ton per subplot provided the **TABLE 602-12** criteria is met and no  $V_a$  penalty is incurred.

When the increased lot size criteria are again met for 4 consecutive sublots, the subplot may be increased as the limits given above.

**h. Decreased Lot Size for Small Quantities.** This is to be used when a small quantity (less than 3,000 tons) of a particular mix will be used. Use the plan quantity for the lot size. Reduce the subplot size below 750 tons by dividing the lot into 3 or 4 equal sublots. Before beginning production, provide the Engineer with the number and size of the sublots.

**i. Pre-Production Mix.** Test and evaluate a pre-production mix, limited to a maximum of 200 tons from each plant and type of mix before production of that mix. Evaluate the pre-production mix at initial start-up and after suspension of production resulting from failing test results. Do not adjust  $V_a$  payment for pre-production mixes. Provide a pre-production mix that complies with the gradation, D/B ratio, binder content, VMA, level of compaction for  $N_{ini}$ ,  $N_{des}$ ,  $N_{max}$  and laboratory  $V_a$  requirements prior to starting or resuming production. For binder content,  $V_a$  at

$N_{des}$  and VMA, use the "Single Test Value" listed in **TABLE 602-12** for comparison. For the other tests listed, use the values listed in **TABLE 602-1** for each mix. Except for initial start-up, normal delivery of material to the project before completion of certain test results on pre-production mixes may be authorized by the DME.

Place the material produced for the pre-production mix in locations approved by the DME. On projects where HMA is paid by the ton, consider placing the pre-production mix in non-critical areas such as side roads, entrances, shoulders or deep in the base. The Engineer will pay for material as the material produced, not in the location placed. However to prevent potential cost overruns, do not run an excessive number of "higher cost" pre-production mixes (as determined by the Engineer) on shoulders or entrances.

On projects in which the HMA is paid by the square yard, place pre-production mixes where required by the Contract Documents. A higher quality pre-production mix may be placed at no additional expense to KDOT. If HMA materials which are designated to be placed in the top 4 inches of the pavement structure are placed deeper than 4 inches as a pre-production mix, do not count the material toward the requirement to place the material in the top 4 inches of the pavement section.

At the direction of the Engineer, remove the pre-production mix if it is both out of specification and the material shortens the pavement life or changes the intended function. The Engineer will pay for the replacement of one pre-production mix at 100% of the contract unit price for each mix in the contract (not each mix design). If the HMA is paid by the square yard, then the removed material will be paid for at a rate of \$75 per ton. The Engineer will create a change order (**SECTION 104**) adding the item of work with a unit price of \$75 per ton. The payment will be full compensation to the Contractor for the placement and removal of that pre-production mix. KDOT will not be financially responsible for any subsequent failed pre-production mixes (that require removal) for that mix. The removed material is the property of the Contractor.

The Engineer will not pay for pre-production mixes that are required to be replaced due to poor workmanship or equipment failure. The Engineer will make the final decision to remove a failed pre-production mix with input from the Contractor.

**j. Suspension of Mix Production.** Suspend production of the mix until appropriate corrections have been made, if 2 consecutive test results for any single mix characteristic fail to fall within the limits established by the tolerances shown in the single test value column of **TABLE 602-12**. Additionally, suspend production of the mix until appropriate corrections have been made, if any 4-point moving average value for any single mix characteristic fails to fall within the limits established by the tolerances shown in the 4-point moving average value column of **TABLE 602-12**. Production remains suspended pending the satisfactory results of a pre-production mix, unless waived by the DME.

The Engineer may stop production of HMA at any time the mix or process is determined to be unsatisfactory. Make the necessary corrections before production will be allowed to resume. Failure to stop production of HMA subjects all subsequent material to rejection by the Engineer, or acceptance at a reduced price, as determined by the Engineer.

## **602.9 BASIS OF ACCEPTANCE**

**a. General.** Acceptance of the mixture will be contingent upon test results from both the Contractor and KDOT. The Engineer will routinely compare the variances (F-test) and the means (t-test) of the verification test results with the quality control test results for  $V_a$ ,  $G_{mm}$  and density using a spreadsheet provided by KDOT. If KDOT verification test results do not show favorable comparison with the Contractor's quality control test results, then KDOT test results will be used for material acceptance, material rejection and the determination of any pay adjustment on the  $V_a$  and roadway density. Disputed test results will be handled according to **subsection 602.8c**.

KDOT will use a spreadsheet program to calculate pay adjustments for density and  $V_a$ , and to compare Contractor QC and KDOT QA test results (including  $G_{mm}$ ). KDOT will provide a copy of this program to the Contractor, when requested. Microsoft Excel software is required to run this program; it is the Contractor's responsibility to obtain the correct software. Values computed using equations referenced in this specification may vary slightly from the spreadsheet values due to rounding of numbers. In such cases, the numbers computed by the spreadsheet will govern.

The comparison of quality control and verification tests will be completed using the t-tests to compare their population means and the F-test to compare their variances. The F & t tests, along with the Excel Spreadsheet used to compare the Contractor's QC results and KDOT's QA results, are described in Section 5.2.6 – Comparison of Quality Control and Verification Tests, Part V. (Examples of Air Voids F & t tests, along with Density F & t tests are shown in this section.) Additional information on the program may be obtained from the Bureau of Construction and Materials.

**b. Asphalt Density Pay Adjustment for "HMA Overlay" Bid Items.** Mixes with specified thickness of less than 1½ inches are not subject to the asphalt density pay adjustments.

For mixes with specified thickness of 1½ inches or greater: Asphalt density pay adjustment for compaction of the completed pavement shall be by lot, based on the percentage of  $G_{mm}$  obtained. Compute the asphalt density pay adjustment (incentive or disincentive) by multiplying the density pay adjustment factor ( $P_D$ ) times the number of tons included in the lot times \$75 per ton. (Air voids lots and density lots are normally of different sizes.) This adjustment will be paid for under the bid item Asphalt Density Pay Adjustment.

Density pay factors will be determined from **TABLE 602-15**. (For **TABLE 602-15**, average the percent of  $G_{mm}$  values to 0.01% and calculate the density pay adjustment factors rounded to the thousandths).

<b>TABLE 602-15: DENSITY PAY FACTORS FOR SPECIFIED THICKNESS<sup>4</sup></b>			
<b>Specified Thickness →</b>	<b>≥ 2"</b>	<b>≥ 1½"</b>	
	<b>All</b>	<b>Continuous Action<sup>5</sup></b>	<b>No Continuous Action<sup>6</sup></b>
<b>% of <math>G_{mm}</math> Average of 10 Density Tests<sup>1</sup></b>	<b>Pay Factor<sup>2</sup></b>	<b>Pay Factor<sup>2</sup></b>	
94.00% or greater	1.040	1.040	
93.00 to 93.99%	A1	A2	
92.00 to 92.99%	1.000	A2	
91.00 to 91.99%	A3	1.000	
90.00 to 90.99%	A3	A4	
89.00% to 89.99%	0.840 or Remove <sup>3</sup>	A4	
less than 89.00%	0.840 or Remove <sup>3</sup>	0.840 or Remove <sup>3</sup>	

<sup>1</sup>For low daily production rates less than 1000 tons, or when the Engineer's verification tests are to be used for asphalt density pay determination, the lot sample size is as determined in **TABLE 602-10**.

<sup>2</sup>Shoulders: For shoulders with a plan width greater than 3 feet and any shoulder not placed at the same time as the traveled way, compact the HMA in the lot to a minimum of 91.00% (if specified thickness is ≥2") or 90.00% (if the specified thickness is from 1½" to 1⅞") of the  $G_{mm}$ . Otherwise, the Engineer will determine whether the HMA in the lot may remain in place or be removed. Any such material left in place shall have a density pay factor of 0.950 or less.

<sup>3</sup>Low Density: The Engineer will determine if the traveled way, shoulders with a plan width of 3 feet or less and placed with the traveled way, ramps, acceleration and deceleration lanes may remain in place or be removed. The Engineer will notify the Contractor before 11:00 AM of the next working day if the area is to be removed. Any such material left in place shall have a density pay factor of 0.840.

<sup>4</sup>Specified thickness is the total thickness shown in the Contract Documents for the mix being placed.

<sup>5</sup>Use for ≥1½" when another continuous action, such as milling, surface recycling, cold recycling or overlay is completed ahead of this overlay.

<sup>6</sup>Use for ≥1½" when another continuous action is not completed before the overlay.

#### **Calculations for Density Pay Factors A1, A2, A3 and A4:**

$$A1 = [100 + 4 (\% \text{ of lot } G_{mm} - 93.00)] \div 100$$

$$A2 = [100 + 2 (\% \text{ of lot } G_{mm} - 92.00)] \div 100$$

$$A3 = [84 + 8 (\% \text{ of lot } G_{mm} - 90.00)] \div 100$$

$$A4 = [84 + 8 (\% \text{ of lot } G_{mm} - 89.00)] \div 100$$

#### **Density Pay Adjustment Factor Calculation:**

$$\text{Density Pay Adjustment Factor } (P_D)^* = \text{Density Pay Factor} - 1.000$$

\* $P_D$  rounded to the nearest thousandth

**c. Asphalt Density Pay Adjustment for "HMA Surface", "HMA Base" and "HMA Pavement" Bid Items.** Asphalt Density Pay Adjustment for compaction of the completed pavement shall be by lot, based on the percentage of  $G_{mm}$  obtained. This adjustment will be paid for under the bid item Asphalt Density Pay Adjustment. Compute the Asphalt Density Pay Adjustment (positive or negative) by multiplying the Density Pay Adjustment factor ( $P_D$ ) times the number of tons included in the lot times \$75 per ton. The Asphalt Density Pay Adjustment will be added or subtracted on the pay estimate. For shoulders with a plan width of less than or equal to 3 feet, and placed at the same time as the traveled way, the  $P_D$  for the traveled way will apply. The  $P_D$  does not apply to sideroads, entrances, crossovers and other incidental surfacing. Use KDOT test results for the lot to determine the  $P_D$  when the statistical comparison between the quality control and the verification tests fail (see **subsection 602.9a**).

**Lot Size:** A lot shall normally be comprised of the results of 10 tests performed on a day's placement of a given mix placed in a given lift. Lot size is defined in **subsection 602.6**. (Air void lots and density lots are normally of different sizes).

**Shoulders:** For all shoulders with a plan width greater than 3 feet and any shoulder not placed at the same time as the traveled way, the lower specification limit (LSL) is 90.00%. When the lower percent within limits (**PWL<sub>LD</sub>**) is 50.00% or more for the lot, **P<sub>D</sub>** is zero. When the **PWL<sub>LD</sub>** is less than 50.00% for the lot, the Engineer will determine whether the HMA in the lot may remain in place or be removed. Any such material left in place will have a **P<sub>D</sub>** of -0.050, unless the Engineer establishes lower values for **P<sub>D</sub>** (-0.100, -0.200, -0.300, etc.) as a condition of leaving the material in place.

**Determination of **P<sub>D</sub>** and **PWL<sub>LD</sub>**:** Calculate the lower density quality index (**Q<sub>LD</sub>**) for each lot using Equation 1 and round to hundredths. Locate the **Q<sub>LD</sub>** value in the left column of the Percent Within Limits (PWL) Table in Section 5.2.1 - Statistics, Part V. Select the appropriate **PWL<sub>LD</sub>** value by moving across the selected quality index row to the column representing the number of samples in the lot.

If **Q<sub>LD</sub>** is greater than the largest quality index value shown in the table, use 100.00 as the value for **PWL<sub>LD</sub>**.

If **PWL<sub>LD</sub>** is less than 50.00% for the lot, the Engineer will determine if the material in the lot may remain in place. If the material is left in place, the value of **P<sub>D</sub>** for the lot will be equal to -0.160, unless the Engineer establishes lower values for **P<sub>D</sub>** (-0.200, -0.300, etc.) as a condition of leaving the material in place. Otherwise, calculate **P<sub>D</sub>** using Equation 2 and round to thousandths.

**Equation 1:** 
$$Q_{LD} = \frac{\bar{X} - LSL}{S}$$

$\bar{X}$  is the average measured percent of  $G_{mm}$  of all samples within a lot rounded to hundredths.

LSL is the lower specification limit for density and is defined as 91.00% of  $G_{mm}$  for traveled way plan thickness 2 inches and less and 92.00% of  $G_{mm}$  for traveled way plan thickness greater than 2 inches.

S is the standard deviation of the measured density of all samples within a lot and is calculated using equation (4) in Section 5.2.1, Part V, rounded to hundredths.

**Equation 2:** 
$$P_D = (PWL_{LD} * 0.004) - 0.360$$

**d. Asphalt Air Void Pay Adjustment.** Asphalt Air Void ( $V_a$ ) Pay Adjustment will be made on a lot basis and based on measured  $V_a$  from samples of plant produced material. This adjustment will be paid for under the bid item Asphalt Air Void Pay Adjustment. The  $V_a$  pay adjustment factor (**P<sub>V</sub>**) (positive or negative) will be determined and used to compute the  $V_a$  Pay Adjustment by multiplying **P<sub>V</sub>** times the number of tons included in the lot times \$75 per ton. The  $V_a$  Pay Adjustment will be added or subtracted on the pay estimate. When the statistical comparison between the quality control and the verification tests pass, use the procedures in **subsection 602.9d.(1)** to compute **P<sub>V</sub>**. When the statistical comparison fails, calculate **P<sub>V</sub>** using procedures in **subsection 602.9d.(2)**.

**Lot Size:** A lot shall normally be comprised of the results of 4 contiguous individual  $V_a$  tests performed on gyratory compacted samples of a given mix design. Lot size is defined in **subsections 602.8f**, **602.8g**, and **602.8h**. When there are 1 or 2 tests remaining, such as at the end of a project or season, combine them with the previous 4 tests to create a 5 or 6 test lot, respectively. When there are 3 tests remaining, combine the 3 tests into a lot. (Air voids lots and density lots are normally of different sizes).

(1) Air Voids Pay Adjustment Factor (Passing t-test). Calculate the upper and lower  $V_a$  quality indices (**Q<sub>UV</sub>** and **Q<sub>LV</sub>**) for each lot using Equations 3 and 4, respectively and round to hundredths. Locate the **Q<sub>UV</sub>** value in the left column of the Percent Within Limits (PWL) Table in Section 5.2.1 – Statistics, Part V. Select the appropriate upper percent within limit value (**PWL<sub>UV</sub>**) by moving across the selected quality index row to the column representing the number of samples (N) in the lot. Repeat the process using the **Q<sub>LV</sub>** value and select the appropriate value for the lower percent within limits (**PWL<sub>LV</sub>**). If the **Q<sub>UV</sub>** or **Q<sub>LV</sub>** value is greater than the largest quality index value shown in the table, then a value of 100.00 is assigned as the value for **PWL<sub>UV</sub>** or **PWL<sub>LV</sub>**, respectively. If both **Q<sub>UV</sub>** and **Q<sub>LV</sub>** exceed the values shown in the table, a value of 100.00 is assigned as the value for both **PWL<sub>UV</sub>** and **PWL<sub>LV</sub>**. If either **Q<sub>UV</sub>** or **Q<sub>LV</sub>** is a negative value or **PWL<sub>UV</sub> + PWL<sub>LV</sub>** is less than 150.00, the Engineer will determine if the material in the lot may remain in place. If the Engineer determines that the material may remain in place then the maximum value of **P<sub>V</sub>** for the lot will be equal to -0.120. The Engineer may establish lower values for **P<sub>V</sub>** (-0.200, -0.300, etc.) in such instances. Otherwise, calculate **P<sub>V</sub>** using Equation 5 and round to thousandths.

**Equation 3:** 
$$Q_{UV} = \frac{USL - \bar{X}}{S}$$

**Equation 4:** 
$$Q_{LV} = \frac{\bar{X} - LSL}{S}$$

$\bar{X}$  is the average measured  $V_a$  of all samples within a lot rounded to hundredths.

USL is the upper specification limit for  $V_a$  and is defined as 4.00%.

LSL is the lower specification limit for  $V_a$  and is defined as 2.00%.

$S$  is the standard deviation of the measured  $V_a$  for all samples within a lot and is calculated using equation (4) in Section 5.2.1 - Statistics, Part V, rounded to hundredths.

**Equation 5:** 
$$P_V = ((PWL_{UV} + PWL_{LV} - 100.00)(0.003)) - 0.270$$

$PWL_{UV}$  is the upper percent within limits value for  $V_a$ .

$PWL_{LV}$  is the lower percent within limits value for  $V_a$ .

(2) Air Voids Pay Adjustment (Failing t-Test). If the t-test fails, KDOT's test result will be used to calculate the  $P_V$  for the lot. Follow the procedures given in **subsection 602.9d.(1)** to determine the  $P_V$  or disposition of the lot. Use the values from **TABLE 602-16** to calculate  $Q_{UV}$ ,  $Q_{LV}$ ,  $PWL_{UV}$  and  $PWL_{LV}$  in Equations 3, 4 and 5 in **subsection 602.9d.(1)**.

<b>TABLE 602-16: Statistical Values for Air Voids Pay Adjustment for Failing t-Test</b>		
<b>Term</b>	<b>Definition</b>	<b>Value</b>
$\bar{X}$	Average or Mean	KDOT's test result for the lot
$S$	Standard Deviation	0.50
USL	Upper Specification Limit	4.50%
LSL	Lower Specification Limit	1.50%
N	Sample Size	3

#### **602.10 DETERMINATION OF THICKNESS, THICKNESS PAY ADJUSTMENT AND AREA PAY ADJUSTMENTS FOR "HMA PAVEMENT" AND "HMA PAVEMENT SHOULDER" BID ITEMS**

**a. General.** Construct the pavement to the dimensions shown in the Contract Documents. Inform the Engineer when a section is ready for coring and measurement of width and length. Complete all paving of the shoulder and driving lanes within this section, unless otherwise approved by the Engineer.

A driving lane is defined as mainline lanes, acceleration lanes (including tapers), deceleration lanes (including tapers), auxiliary lanes, ramp lanes or combination thereof.

When shoulders, medians and widenings are placed monolithically with the adjacent driving lane, and there is not a separate bid item for shoulders, then the shoulders are considered as part of the driving lane, and are subjected to the same unit price adjustment as the driving lane.

**b. Measurements.** The Engineer will divide the projects into lots. A lot is comprised of 5 sublots with the same plan thickness. A sublot is defined as a single driving lane or a single shoulder, with an accumulative length of 1000 feet. If the last lot has 1 or 2 sublots (such as at the end of a project or season), combine them with the previous lot to create a lot with 6 or 7 sublots, respectively. Consider as a single lot if there are 3 or 4 sublots in the final lot.

The Engineer will generate 1 random location for coring within each sublot. Do not take a core within 1 foot of a longitudinal joint or edge. Obtain the cores with the Engineer present.

Take a 4-inch diameter core from the selected sites. Mark each core with its lot and sublot number, and transport to the KDOT field lab.

For information only, the Engineer will determine the thickness of each HMA mixture and the total HMA base for each core.

The Engineer will determine the total core thickness for pay by taking 3 caliper measurements at approximately 120° apart and record each to the nearest 0.1 inch. The average of the 3 caliper measurements rounded to the nearest 0.1 inch shall represent the average measured thickness. The Engineer will use the total pavement thickness measurements to determine thickness pay adjustment factors.

The Engineer will provide a copy of the results to the Contractor before the end of the following working day.

Prior to coring, the Contractor may request that areas trimmed without automatically controlled equipment be handled separately. (This would require the Contractor to designate the area as a lot before knowing the actual core thickness.) When requested and approved by the Engineer, each area will be considered a lot. Divide the area into 5 sublots and obtain 1 core from each subplot.

For Percent Within Limits (PWL) thickness analysis, if any subplot thickness exceeds the design thickness by more than 1.0 inch, the Excel spreadsheet will automatically consider that subplot thickness to be 1.0 inch more than the design thickness. The spreadsheet will recalculate a new lot mean and sample standard deviation based on the adjusted value.

Dry the core holes, tack the sides and bottom, fill them with a HMA mixture (approved for the project) and properly compact it by the end of the next working day.

**c. Deficient Measurements for Driving Lanes.** When any full depth core for driving lanes is deficient by 1.0 inch or greater from the specified thickness, take exploratory cores at intervals a minimum of 50 feet in each direction (parallel to the centerline) from the deficient core.

Continue to take exploratory cores in each direction until a core is taken that is deficient a maximum of 0.5 inch. Exploratory cores are used only to determine the length of pavement in a lot that is to be overlaid, as approved by the Engineer.

The minimum overlay length (with surface mix) shall be equal to the distance between the cores that are deficient by a maximum of 0.5 inch, and the width to be paved shall be full width of the roadway (driving lanes and shoulders) when this occurs.

The minimum overlay thickness is 3 times the nominal maximum aggregate size.

Complete the overlay to the satisfaction of the Engineer. Mill butt joints on the ends of the overlay area. The Engineer will not pay for any milling costs.

The exploratory cores are not used to determine thickness pay adjustment factors. Randomly select another core (outside the overlay area) to represent the subplot.

**d. Deficient Measurements for Shoulders.** When any full depth core taken from the shoulders is deficient by greater than 1.5 inches, take exploratory cores at intervals a minimum of 50 feet in each direction (parallel to the centerline) from the deficient core.

Continue to take exploratory cores in each direction until a core is only deficient a maximum of 0.8 inches.

Exploratory cores are used only to determine the length of pavement in a lot that is to be removed and replaced, or accepted at a reduced price (in addition to any disincentive assessed on that lot), as approved by the Engineer.

The minimum repair length is equal to the distance between the cores that are deficient a maximum of 0.8 inches, and the full width of the shoulder.

Mill butt joints on the ends of the overlay area. The Engineer will not pay for any milling costs. Unless approved by the Engineer, replacing includes complete removal of all HMA within the area defined by the results of the exploratory cores. Rework, stabilize (if required) and regrade the subgrade. When required, reconstruct the base and replace all HMA mixes shown in the Contract Documents. Obtain 1 random core within this subplot and use its core length to determine the thickness pay adjustment factor.

**e. Asphalt Pavement Area Pay Adjustment.** Determine the areas for pay and pay adjustment as shown in **TABLE 602-18**. The KDOT spreadsheet program will calculate these areas. This adjustment will be paid for under the bid item Asphalt Pavement Area Pay Adjustment.

Irregularly shaped areas may have to be calculated outside the program and the area entered into the program. Compute pay per lot for areas placed and not placed (deducted) as shown in Equations 10, 11, 12 and 13.

<b>Equation 10:</b>	$\text{Pay for Driving Lane} = (\sum \text{PDLA})(\text{BP})$
<b>Equation 11:</b>	$\text{Pay Deduct for Driving Lanes} = 2(\sum \text{PDLDA})(\text{BP})$
<b>Equation 12:</b>	$\text{Pay for Shoulder} = (\sum \text{PSA})(\text{BP})$
<b>Equation 13:</b>	$\text{Pay Deduct for Shoulder} = 2(\sum \text{PSDA})(\text{BP})$

$\sum \text{PDLA}$  = Pay Driving Lane Area per Lot, Square Yard

$\sum \text{PDLDA}$  = Pay Driving Lane Deduct Area per Lot, Square Yard

$\sum \text{PSA}$  = Pay Shoulder Area per Lot, Square Yard

$\sum \text{PSDA}$  = Pay Shoulder Deduct Area per Lot, Square Yard

BP = Bid Price for either the driving lanes or the shoulder, as applicable

TABLE 602-17: HMA AREA ABBREVIATIONS			
Abbreviation		Definition	Units
PDLA	=	Pay Driving Lane Area per Sublot	Sq Yd
PDLDA	=	Pay Driving Lane Deduct Area per Sublot,	Sq Yd
PSA	=	Pay Shoulder Area per Sublot	Sq Yd
PSDA	=	Pay Shoulder Deduct Area per Sublot	Sq Yd
MDLW	=	Measured Driving Lane Width	Ft
MSW	=	Measured Shoulder Width	Ft
MTLW	=	Measured Total Lane Width (includes shoulder, if any)	Ft
PDLW	=	Plan Driving Lane Width	Ft
PSW	=	Plan Shoulder Width	Ft
PTLW	=	Plan Total Lane Width (includes shoulder, if any)	Ft
EDLW	=	Excess Driving Lane Width	Ft
SL	=	Sublot Length	Ft

TABLE 602-18: HMA AREA SUBLOT CALCULATIONS <sup>1</sup>				
Condition	PDLA <sup>2</sup>	PDLDA <sup>2</sup>	PSA <sup>2</sup>	PSDA <sup>2</sup>
	(Sq Yd)	(Sq Yd)	(Sq Yd)	(Sq Yd)
<b>Projects with a Separate Bid Item for Shoulder</b>				
<b>Narrow Driving Lane</b>				
MSW is less than PSW	(SL)(MDLW)	(SL)(PDLW-MDLW)	(SL)(MSW)	(SL)(PSW-MSW)
MSW is greater than PSW	(SL)(MDLW)	(SL)(PDLW-MDLW)	(SL)(MSW <sup>3</sup> )	0
<b>Wide Driving Lane</b>				
MSW + EDLW is less than PSW	(SL)(PDLW)	0	(SL)(MSW+EDLW)	(SL)(PSW-MSW-EDLW)
MSW + EDLW is greater than PSW	(SL)(PDLW)	0	(SL)(MSW+EDLW <sup>4</sup> )	0
<b>Projects without a Separate Bid Item for Shoulder<sup>5</sup></b>				
Narrow Driving Lane and Shoulder	(SL)(MTLW)	(SL)(PTLW-MTLW)	N/A	N/A
Wide Driving Lane and Shoulder	(SL)(MTLW <sup>6</sup> )	0	N/A	N/A

<sup>1</sup>Deductions will be made for unplaced areas.

<sup>2</sup>Calculate the areas to the nearest 0.01 square yards. Measure the lengths and widths to the nearest 0.01 feet. Divide the result of all equations in this table by 9 so that the resulting units are square yards.

<sup>3</sup>MSW shall be between PSW and PSW + 0.25 feet. Any excess width over 0.25 feet will not be included in PSW.

<sup>4</sup>MSW + EDLW shall be between PSW and PSW + 0.25 feet. Any excess width over 0.25 feet will not be included in PSW.

<sup>5</sup>Shoulder is normally 0.00 feet to 3.00 feet wide and placed at the same time as the driving lane. PTLW = PDLW + PSW

<sup>6</sup>MSTLW shall be between PTLW and PTLW + 0.25 feet. Any excess width over 0.25 feet will not be included for pay.

**f. Asphalt Pavement Thickness Pay Adjustment.** Compute the Asphalt Thickness Pay Adjustment for the driving lanes (TPA<sub>DL</sub>) and shoulders (TPA<sub>SH</sub>) using Equation 6 or 7, respectively. Compute the Asphalt Thickness Pay Adjustment factor (P<sub>T</sub>) as shown in Equation 9. Determine area calculations for the driving lanes and shoulders as shown in **TABLE 602-18**. **TABLE 602-17** provides the definition for the abbreviations used in **TABLE 602-18**. Enter the measured values into the spreadsheet program to determine PDLA and PSA.

This adjustment will be paid for under the bid item Asphalt Pavement Thickness Adjustment.

**Equation 6:**  $TPA_{DL} = P_T (\sum PDLA) (\$3.50) (\text{Plan Thickness})$

**Equation 7:**  $TPA_{SH} = P_T (\sum PSA) (\$3.20) (\text{Plan Thickness})$

TPA<sub>DL</sub> = Thickness Pay Adjustment per Lot for Driving Lane

TPA<sub>SH</sub> = Thickness Pay Adjustment per Lot for Shoulder  
 $\Sigma$ PDLA = Pay Driving Lane Area per Lot, Square Yard  
 $\Sigma$ PSA = Pay Shoulder Area per Lot, Square Yard  
 Plan Thickness = HMA Thickness shown on Plans, Inches

KDOT will use a spreadsheet program to calculate thickness pay adjustments. KDOT will provide a copy of this program to the Contractor, when requested. It is the Contractor's responsibility to obtain the Microsoft Excel software required to run this program. Values computed using equations referenced in this specification may vary slightly from the spreadsheet values due to rounding of numbers. In such cases the numbers computed by the spreadsheet take precedence.

**Thickness Quality Index ( $Q_T$ ) Computation.** In each lot, calculate  $Q_T$  for the total pavement thickness using Equation 8 and round to hundredths.

**Equation 8:** 
$$Q_T = \frac{\bar{X} - LSL}{S}$$

$\bar{X}$  = Average total core length of all samples representing a lot, rounded to the nearest 0.1 inch. (Adjust core length before averaging, as shown in **subsection 602.10b.**)

LSL = Lower specification limit for thickness. For driving lanes use 0.5 inch less than the total plan driving lane thickness shown on the typical section. For shoulders, use 0.8 inch less than the total plan shoulder thickness shown on the typical section.

S = Sample standard deviation of the measured core lengths of all samples representing a lot and is calculated using equation (4) in Section 5.2.1 – Statistics, Part V, rounded to hundredths.

Use the computed  $Q_T$  to determine the thickness Percent Within Limits value ( $PWL_T$ ) by locating the  $Q_T$  in the left column of the Percent Within Limits (PWL) Table in Section 5.2.1 - Statistics, Part V. Select the appropriate  $PWL_T$  by moving across the selected  $Q_T$  row to the column representing the number of samples in the lot.

If the computed  $Q_T$  is a negative value, then the lot and all adjacent areas (full width of roadway) shall be overlaid as determined by the Engineer. After the lot has been overlaid, randomly select another core for each subplot, and calculate a new pay factor. For lots that have been entirely overlaid, the maximum pay factor is zero.

If the computed  $Q_T$  is greater than the largest  $Q_T$  shown in the PWL Table, a value of 100.00 is assigned as the  $PWL_T$  for thickness.

For each lot and all lanes and shoulders, compute the thickness pay factor ( $P_T$ ) for the total pavement thickness using Equation 9 and round to nearest thousandth. No bonus will be paid for shoulders, thus use  $P_T = 0.000$  whenever  $P_T$  calculates greater than 0.000 for shoulders.

**Equation 9:**

$$P_T = \left( \frac{(PWL_T) * 0.3}{100} \right) - 0.270$$

**g. Minimum Quantity of HMA for Square Yard Projects with "HMA Pavement" and HMA Pavement Shoulder" Bid Items.** For the total project, supply a minimum of 93% of  $G_{mm}$  required by the surface course of driving lanes and shoulders and the top base course of driving lanes and shoulder. Calculate the minimum quantity of those 2 mixes, individually as follows:

**Equation 14:** 
$$\text{Minimum Quantity (Tons)} = \frac{0.93 (A) (T) (G_{mm})}{42.7}$$

A = Area in square yards for each of the mixes.

T = Plan thickness in inches of surface course and the top base course of driving lanes and shoulders.

$G_{mm}$  = Theoretical maximum specific gravity equals the average  $G_{mm}$  value used in the first 5 lots or the average  $G_{mm}$  for 1/2 of the project (whichever is less) for the 4 mixes listed in "T" in Equation 14. Determine the average  $G_{mm}$  from the Excel worksheet titled "Density F & T Test Worksheet".

If this minimum quantity of surface course or base course is not placed, a deduction of \$75 per ton will apply to the quantity not placed for each mix. This will be paid using the bid item Contract Deduct which will be an item added to the contract.

#### 602.11 MEASUREMENT AND PAYMENT

**a. "HMA Base", "HMA Surface" and "HMA Overlay" Bid Items.** The Engineer will measure HMA Base, HMA Surface and HMA Overlay by the ton of material at the time of delivery to the road. Batch weights will not be allowed as a method of measurement unless all the following conditions are met:

- the plant is equipped with an automatic printer system approved by the Engineer;
- the automatic printer system prints the weights of material delivered; and
- the automatic printer system is used in conjunction with an automatic batching and mixing control system approved by the Engineer.

Provide a weigh ticket for each load. Due to possible variations in the specific gravity or weight per cubic foot of the aggregates, the tonnage used may vary from the proposal quantities and no adjustment in contract unit price will be made because of such variances.

Payment for "HMA Base (\*)(\*\*)(\*\*\*)", "HMA Surface (\*)(\*\*)(\*\*\*)" and "HMA Overlay (\*)(\*\*)(\*\*\*)" at the contract unit prices is full compensation for the specified work. Any pay adjustments will both be applied and the payment adjusted accordingly.

Sideroads, entrances and mailbox turnouts that are not shown in the Contract Documents that are to be surfaced shall be paid for at 1½ times the unit price for "HMA Surface (\*)(\*\*)(\*\*\*)", "HMA Base(\*)(\*\*)(\*\*\*)" or "HMA Overlay (\*)(\*\*)(\*\*\*)".

**b. "HMA Pavement" and "HMA Shoulder" Bid Items.** The Engineer will measure HMA Pavement and HMA Pavement Shoulder by the square yard of the measured in-place material. All lifts, except the surface course, will be measured by the Contractor and verified by the Engineer. The Engineer will measure the surface course.

Measure each shoulder width, each driving lane width and subplot length separately. Measure the lengths (to the nearest 0.01 feet) a minimum of once per subplot. The location of the width measurements will be the same location as the mainline cores which were established using random numbers. Before the end of the next working day, type and submit to the Engineer, the Contractor's individual measurements and the sum of the 2 driving lanes. Likewise, when the surface course is completed the Engineer will provide a typed copy of the surface course measurements to the Contractor before the end of the next working day.

If the driving lane and shoulder (measured from centerline) is less than 0.25 feet (per side) deficient, a deduction will be assessed. If the roadway is greater than 0.25 feet (per side) deficient, correction will be required. The correction will be proposed by the Contractor and must be approved by the Engineer. After satisfactory correction by the Contractor, the deduction for the narrow roadway will be eliminated for the areas corrected.

The Engineer will measure the subplot length and width (to the nearest 0.01 feet). Measure the width from the construction joint to the top of the slope of HMA pavement. Calculate the pay area for each lot to the nearest square yard. Unless the Engineer authorizes in writing to increase the area of HMA pavement, the Engineer will use dimensions shown in the Contract Documents and as measured in the field to calculate the final pay quantity. If the Engineer authorizes in writing to increase the area of HMA pavement or shoulder, the additional area will be measured and paid for as "HMA Pavement (#) (##)" or "HMA Pavement (#) Shoulder", respectively. The length will be measured horizontally along the centerline of each roadway or ramp.

Payment for "HMA Pavement (#) (##)" and "HMA Pavement (#) Shoulder" at the contract unit prices is full compensation for the specified work.

The Asphalt Pavement Thickness Adjustment and Asphalt Pavement Area Pay Adjustment will be entered on the Contractor's Payment Vouchers (intermediates and final) after each lot of the surface course (driving lanes and shoulders) has been completed.

The Contractor will receive no additional compensation for overlaying or for removing and replacing areas of deficient thickness. Exploratory cores and cores taken to determine pavement thickness will not be measured for payment. The Engineer will apply a Contract Deduct for surface course (driving lanes and shoulders) and top base course (driving lanes and shoulders) mix not placed on the project as determined using Equation 14. The Contract Deduct will be computed by the spreadsheet and be an item added to the contract.

If the project has a large amount of grinding required for pavement smoothness, the Engineer may require the Contractor to cut cores after the grinding is complete. These cores will be used in the spreadsheet in place of the cores originally cut.

**c. Emulsified Asphalt.** The Engineer will measure emulsified asphalt used for tack by the ton. Payment for "Emulsified Asphalt" at the contract unit price is full compensation for the specified work.

**d. Asphalt Core (Set Price).**

(1) Nuclear Density Gauge Calibration. The Engineer will measure each asphalt core required by the Engineer to calibrate the nuclear density gauges. No payment will be made for cores deemed unsuitable for calibrating the nuclear density gauges. No payment will be made for cores taken at the Contractor's option to determine density.

(2) Nuclear Density Dispute Resolution. If during nuclear density dispute resolution, the Contractor's test results are used for payment, the Engineer will measure each core taken for payment at the Asphalt Core (Set Price). If KDOT's test results are used for payment, then no payment for cores will be made for nuclear density dispute resolution.

(3) Payment for "Asphalt Core (Set Price)" at the contract set unit price is full compensation for the specified work.

**e. Material for HMA Patching (Set Price).** When the Contractor is required to remove any existing base course, subgrade or surface course (unless damaged by the Contractor) and provisions are not made in the Contract Documents, the Engineer will measure the material used for repair and patching (either HMA-Commercial Grade or a specified mix on the project) separately, by the ton at the time of delivery to the road. The Engineer will not measure the quantity of material used in the repair of damage due to the Contractor's negligence. The Engineer will measure HMA materials by the ton. Use cold feed virgin gradation test results for acceptance as described in **SECTION 611** or combined gradation results for acceptance in accordance with **TABLE 602-1**.

Payment for "Material for HMA Patching (Set Price)" at the contract set unit price includes all excavation, compaction of subgrade or subbase if required, disposal of waste material and all material (including emulsified asphalt for tack), all labor, equipment, tools, supplies, incidentals and mobilization necessary to complete the work. Pay adjustments will not be applied to this material.

**f. Quality Control Testing (HMA).** The Engineer will measure Quality Control Testing (HMA) performed by the Contractor on a per ton basis of HMA Surface, HMA Base, HMA Overlay and HMA Pavement placed on the project. No adjustment in the bid price will be made for overruns or underruns in the contract quantity. The bid price will constitute payment for all necessary mix design testing, field process control testing, the testing laboratory and all necessary test equipment.

The Engineer will not measure for payment Quality Control Testing (HMA) for the bid item Material for HMA Patching (Set Price).

Payment for "Quality Control Testing (HMA)" at the contract unit price is full compensation for the specified work.

**SAMPLING AND TESTING FREQUENCY CHART  
CONTRACTOR QUALITY CONTROL TESTING**

CONSTRUCTION OR MATERIAL TYPE 2015 Std. Spec. (SS 2015)	TESTS REQUIRED (RECORDED TO)	TEST METHOD	CODE	QUALITY CONTROL BY CONTRACTOR	CODE	VERIFICATION BY KDOT
<b>DIVISION 300</b>						
<b>CEMENT TREATED BASE (CTB)</b> Sec. 306 & 1105	Sieve Analysis of Aggregate (1%, 0.1% for No. 200 [75 µm] sieve, of mass)	KT-02	c h	1 per day.		1 per week.
	Moisture Tests (0.1 g or 0.01% of mass)	KT-11 or KT-41		4 per day per design.		1 per week.
	Density (0.1 lb/ft³ [1 kg/m³] or 0.1% of optimum density)	KT-37 or KT-20*		1 per day per design (* KT-20 option is only permitted in conjunction with a fluid mix.)		1 per project per design.
	Compressive Strength (1 psi [0.01 MPa])	KT-37		1 specimen per subplot		1 specimen per lot.
<b>Completed Base</b>	Field Density Tests (0.1 lb/ft³ [1 kg/m³] or 0.1% of optimum density)	KT-13 or KT-41		4 per day per design.		1 per week per design.
	Moisture Tests (0.1 g or 0.01% of mass)	KT-11 or KT-41		4 per day per design.		1 per week per design.

**SAMPLING AND TESTING FREQUENCY CHART**  
**QUALITY CONTROL/QUALITY ASSURANCE SPECIFICATIONS**

<u>CODE</u>	<u>INSTRUCTION</u>
a	The contractor may reduce the sampling and testing frequency to one test per 1,000 yd <sup>3</sup> (1,000 m <sup>3</sup> ) provided the first two tests each day show compliance with the specification requirements.
b	Sampled by the district field personnel, or contractor and tested at KDOT Central Materials Laboratory (Materials and Research Center).
c	The aggregate producer's tests may be used for quality control purposes if the tests were performed by an appropriately certified technician. In such cases, the contractor shall perform testing as necessary to determine the degrading effects of hauling and stockpiling on the individual aggregates. For CTB, the minimum testing frequency shall be every 4,000 Tons (4,000 Mg).
d	At least one Modified Lottman test is required weekly. When more than 10,000 Tons (10,000 Mg) of production occurs in a week, then run additional tests to meet the requirement of 1 test per 10,000 Tons (10,000 Mg).
e	Specification compliance will be determined on a producer basis not on a project basis. Producer and product testing frequency is maintained in CMS. Start with one in three loads, then generally, the sampling frequency will be reduced to one sample per six loads and then per twelve loads if test results determined by the Department show satisfactory compliance of the material with the specifications.
f	Determine the Sand Equivalent (SE) value on the combined virgin aggregates on the first lot of production and then frequency may be reduced to one test per week provided the SE value exceeds the minimum specified value by five (5) percentage points. The frequency may be reduced to one test per two weeks provided the SE value exceeds the minimum specified value by 25 percentage points. When any test (including verification and assurance) shows the SE value to be less than five (5) percentage points above the specified minimum value then the testing frequency will revert to one per lot until two consecutive tests exceed the minimum specified value by five (5) percentage points.
g	All aggregate types except siliceous gravels and steel slag will be considered to have at least two crushed faces on 100% of the aggregate particles. For mixes containing crushed or uncrushed siliceous gravels or steel slag, determine the Coarse Aggregate Angularity (CAA) value of the combined virgin aggregate of the first lot of production. After three consecutive passing tests, the frequency may be reduced to one per three lots or one per week. If any of the quality control or verification tests fail, the frequency will revert to one per lot until the above criteria for reduced frequency is met.
h	If during the determination of individual aggregate gradation, clay lumps and soft or friable particles, shale or shale-like particles, or sticks are found then perform KT-7, KT-8, and KT-35, respectively, at such frequencies as jointly deemed necessary by the Contractor and the District Materials Engineer.
i	For small lots [lots with less than 1,000 tons (1,000 Mg)], the number of tests may be reduced (see special provision).
j	Provide access to Contractor owned forced air ignition furnace, ovens, and Superpave Gyratory compactor, as required, for the State Inspector to perform verification tests.

## **SAMPLING AND TESTING FREQUENCY CHART**

### **QUALITY CONTROL/QUALITY ASSURANCE SPECIFICATIONS**

#### CODE

#### INSTRUCTION

- k Engineer's discretion. Frequency of tests shall be agreed upon by the Field Engineer and the District Materials Engineer. Frequency will be governed by field conditions. Written documentation of the agreed upon testing frequency shall be included in the project records.
- l This testing of crushed gravel is only needed to confirm that 35% or less natural sand is used in the traveled way mixes. If 95% or more of crushed gravel is retained on the #8 (2.65 mm) sieve, then the material must have a minimum Uncompacted Void Content of Coarse Aggregate (UVA) value of 45 when tested in accordance with KT-80. Test at the same frequency as KT-50. Do not use material with a UVA value less than 45.
- m The contractor may reduce the sampling and testing frequency to one test per 2,000 Tons (2,000 Mg) provided the first ten tests show compliance with the specification requirements.
- n If more than one test is performed on the sample, use the average value.
- o Verification method must be the same test method as used for mix design approval.
- p Frequency may be reduced to 1 pre-production verification test per day provided the following are met: 1) Handheld moisture meter is used at least once per every 50 cubic yards of production. 2) The meter has an accuracy of  $\pm 0.5\%$  of the pre-production verification test. 3) Moistures obtained from the meter are used to adjust batch-to-batch moisture corrections.

#### GENERAL NOTES

- All sampling and testing frequencies listed are minimums. Additional quality control, verification, and assurance tests will be performed, when necessary, to provide effective control the work. When any quality control test result fails to comply with the specification requirements then the next subplot of production after obtaining the failing test results will be sampled and tested, regardless of any lesser frequency specified in this appendix.
- For the Construction Management System (CMS), Acceptance Sampling and Tests have been divided into two sections. Items called "ACC" will be Acceptance Tests and will have a quantity assigned. Items called "ACI" will be Acceptance Information Tests and they will normally have a quantity assigned, but not for payment. "ACC" tests make the assignment of tested materials to the contract or mix plant. "Type Insp" must = "ACC" when assignment of a pay quantity is being made. "ACI" when recording test values for additional acceptance information.
- For QUALITY CONTROL BY CONTRACTOR, CMS uses ACI or ACC unless otherwise noted. For VERIFICATION BY KDOT, CMS uses VER unless otherwise noted. For INDEPENDENT ASSURANCE BY KDOT, CMS uses ASW (Assurance Witness), ASR (Assurance Replicate), and ASP (Assurance Split) unless otherwise noted (see section 5.4.2 of this manual).
- For a better explanation of metric (SI) units, see section 5.9, "Sampling and Test Methods Forward", of this manual.
- All samples will be taken from the place of incorporation into the project unless otherwise noted.
